# Fluid Mechanics [6-10 Marks]

Def<sup>n</sup>

→ Fluid: fluid is a substance which deforms continuously for a small amount of shear force also.

Solid → s.m.  
 Incompressible fluid → Liq<sup>n</sup> } fluid (open channel flow)  
 Compressible fluid → Gas

→ Introduction - [properties]

1) Density, mass density, specific mass 'ρ'

$$\rho = \frac{\text{mass}}{\text{Vol}^m} = \frac{kg}{m^3} = ML^{-3}$$

$$\rho_{\text{water}} = 1000 \text{ kg/m}^3, \quad \rho_{\text{air}} = 1.2 \text{ kg/m}^3$$

$$\rho_{\text{sea water}} = 1025 \text{ kg/m}^3$$

$$\rho_{\text{ice}} = 915 \text{ kg/m}^3$$

→  $\rho_{\text{water}}$  is maximum at 4°C

moist air

Dry air

Water vapour

2) Specific weight (γ) = Weight density

$$\gamma = \frac{\text{Weight}}{\text{Vol}^m} = \frac{N}{m^3}$$

$$W = mc \quad | \quad \gamma = \rho g$$

$$\gamma_w = \rho_w \times g$$

$$= 1000 \times 9.81$$

$$\gamma_w = 981 \text{ N/m}^3$$

9) Weight -  $W = mg = F$

$$W_b = \gamma_b \times \text{Vol}_b$$

$$= S_b \cdot g \times \frac{\pi d_b^2 H}{4}$$

$$W_{in} = \gamma_{in} \times \text{Vol}_{in}$$

$$= S_{in} \cdot g \times \frac{\pi d_{in}^2 h}{4}$$

→ Bulk modulus  $M = \frac{\text{Direct stress}}{\text{Volumetric strain}} = \frac{dp}{\left(\frac{dv}{v}\right)} = \frac{dp}{\left(\frac{d\rho}{\rho}\right)}$

#### 4) Viscosity

→ It is a property of a fluid by virtue of which, it offers resistance for the movement of one layer over the other.

→ It due to 1) cohesion → liq.  
2) Molecular Momentum Exchange → gas

**Note** → molecular Momentum Exchange (1) → viscosity (2)

#### Effect of Temp:

① Liquid →  $T \uparrow, \mu \downarrow$

$$\mu \propto \frac{1}{T}$$

Temp increase which breaks the bond of cohesion fluid so, it decrease

$$\mu_f = \frac{\mu_0}{1 + \alpha T + \beta T^2}$$

② Gases →  $T \uparrow, \mu \uparrow$

$$\mu \propto T$$

High Randomness

$$\mu_f = \mu_0 \sqrt{\alpha T - \beta T^2} \quad (\alpha \gg \beta)$$

## Effect of Pressure :

→ With increase in pressure the viscosity increase for both liquid & gases but effect on the liquid is negligible.

eg. liq<sup>n</sup> →  $\rho \uparrow \rightarrow 1 \text{ atm} \rightarrow 1000 \text{ atm}$   
 $\mu \uparrow \rightarrow 1 \text{ unit} \rightarrow 2 \text{ unit}$

→ units of viscosity :

Dynamics $\mu$ (Ns/m <sup>2</sup> or kg/mc)		Kinematics $\nu = \mu/\rho$ (m <sup>2</sup> /sec)	
SI	CGS	SI	CGS
$\frac{\text{Ns}}{\text{m}^2}$ or kg/m.sec	$\frac{\text{Dyne sec}}{\text{cm}^2}$ (poise)	$\frac{\text{m}^2}{\text{sec}}$	$\frac{\text{cm}^2}{\text{sec}}$ (Stoke)
1 poise = $10^{-1} \frac{\text{Ns}}{\text{m}^2}$		1 stoke = $10^{-4} \frac{\text{m}^2}{\text{c}}$	
1 N = $10^5$ Dyne.			

→ Water :

$$\rho = 1000 \text{ kg/m}^3$$

$$S = 1.0$$

$$H = 2.15 \text{ MPa}$$

$$\mu = 1.02 \text{ centipoise} = 1.02 \times 10^{-2} \text{ poise}$$
$$= 1.02 \times 10^2 \times 10^{-1} \text{ Ns/m}^2$$

$$\sigma = 0.075 \text{ N/m}$$

$$\text{vapour pressure} = 2.35 \text{ m of water [Abs]}$$

→ Air

$$\rho = 1.2 \text{ kg/m}^3$$

$$\mu = 1.47 \times 10^{-4} \text{ Ns/m}^2$$

ISRO-10: For a given mass fluid when the pressure increases from 3 MPa to 3.5 MPa causing the density to increase from 500 kg/m<sup>3</sup> to 501 kg/m<sup>3</sup> then the Bulk modulus of fluid (K)

$$\rightarrow K = \frac{dp}{(dv/v)} = \frac{dp}{(d\rho/\rho)} = \frac{3.5 - 3.0}{1/500} = (0.5) \times 500$$

$$\boxed{K = 250 \text{ MPa}}$$

DRDO-09: The increase in pressure required to decrease unit volume of mercury [K<sub>Hg</sub> = 28.5 MPa] by 0.1% is (3)

$$K_{Hg} = \frac{dp}{(dv/v)} = \frac{0.99}{-dv/v} = 28.5$$

$$K_{Hg} = + \frac{dp}{[-dv/v]} \Rightarrow + dp = K \left[ \frac{-dv}{v} \right] = 28.5 \times 10^6 \times \left[ \frac{0.1}{100} \right]$$

$$\boxed{+ dp = 28.5 \text{ kPa}}$$

ES: A liquid whose specific gravity of 0.8 & dynamic viscosity is 10 poise, has kinematic viscosity = (3) (stoke)

$$\rightarrow \gamma = \mu/\rho = \frac{10 \times 10^{-1} \text{ N/s}^2}{0.8 \times 1000} = 12.5 \times 10^{-4} \text{ m}^2/\text{s}$$

$$\boxed{\gamma = 12.5 \text{ stoke}}$$

2) Soap bubble

$$F_p = F_s$$

$$P \times A_c = \sigma \times L$$

$$P \times \frac{\pi d^2}{4} = \sigma (\pi d_o + \pi d_i)$$

but  $d_o = d_i = d$

both externally & internally soap film

$$P = \frac{8\sigma}{d}$$

3) Liquid jet

$$F_p = F_s$$

$$P \times A_c = \sigma \times L$$

$$P \times \pi d = \sigma \times (2\pi L)$$

but fluid flow along dir L not in dir of d so d is diameter

$$P = \frac{2\sigma}{d}$$

fluid is flowing in flow dir so cis is flow so flow

NOTE: Surface tension can also expressed as

$$\gamma = \frac{\text{Surface Energy}}{\text{Surface Area}} = \frac{\text{Joules}}{\text{m}^2} = \frac{\text{N} \cdot \text{m}}{\text{m}^2} = \frac{\text{N}}{\text{m}}$$

Work done to burst a water droplet

$$= \sigma \times (4\pi R^2)$$

$$\frac{\text{N} \cdot \text{m}^2}{\text{m}^2} = \text{N} \cdot \text{m}$$

Ex One bubble is converted into 64 small bubbles

Here is work done to (work on system)  $W = E_2 - E_1$  |  $E_1 = E_2 - W$

$$E_1 + W = E_2$$

$$\rightarrow E_1 = \sigma \times 4\pi R^2$$

$$\rightarrow E_2 = 64 \times \sigma \times 4\pi r^2$$

but  $V_1 = V_2 \Rightarrow \frac{4}{3}\pi R^3 = 64 \times \frac{4}{3}\pi r^3 \Rightarrow R = 4r$

$$W = 64 \times \sigma \times 4\pi r^2 - \sigma \times 4\pi R^2 = 64 \times \sigma \times 4\pi \left(\frac{R}{4}\right)^2 - \sigma \times 4\pi R^2$$

$$W = 4\pi R^2 \sigma (4 - 1)$$

## → Surface Tension:

	$p$
1) Water droplet	$\frac{4\sigma}{d}$
2) Soap bubble	$\frac{8\sigma}{d}$
3) Liquid jet	$\frac{2\sigma}{r}$

→ It is property of liquid surface film to exert tension, it is a force required to maintain unit length in equilibrium

Surface film

GATE

→ Surface tension because of cohesion it is varies inversely with temp

$$\sigma \propto \frac{1}{T}$$

Ref<sup>n</sup> →  $\sigma_{\text{water}} = 0.073 \text{ N/m @ } 30^\circ\text{C}$   
 $\sigma = 0.0569 \text{ N/m @ } 100^\circ\text{C}$   
 $\sigma_{\text{Hg}} = 0.49 \text{ N/m @ } 30^\circ\text{C}$

$p$  = The pressure inside  $\approx$  in excess to outside atm. pressure

1) Water droplet

$$P_i > P_{\text{atm}}$$

$$p = P_i - P_{\text{atm}}$$

$$F_{\text{tension}} = F_{\text{press}}$$

$$F_{\text{pressure}} = F_{\sigma}$$

$$p \times A = \sigma \times L$$

$$p \times \frac{\pi d^2}{4} = \sigma \times \pi d \Rightarrow p = \frac{4\sigma}{d}$$

2) Soap bubble

$$F_p = F_\sigma$$

$$P \times A_c = \sigma \times L$$

$$P \times \frac{\pi d^2}{4} = \sigma [\pi d_o + \pi d_i]$$

but  $d_o = d_i = d$

$$P = \frac{8\sigma}{d}$$

both externally & internally su

3) Liquid jet

$$F_p = F_\sigma$$

$$P \times A_c = \sigma \times L$$

$$P \times L \times d = \sigma \times [2L] \times d$$

$$P = \frac{2\sigma}{d}$$

but fluid flows along dir L not in dir of so d is constant

fluid is flowing or not. when we try to start we find

**NOTE:** Surface tension can also expressed as

$$\gamma = \frac{\text{Surface Energy}}{\text{Surface Area}} = \frac{\text{Joules}}{\text{m}^2} = \frac{\text{N} \cdot \text{m}}{\text{m}^2} = \frac{\text{N}}{\text{m}}$$

Work req<sup>n</sup> to burst a water droplet

$$= \sigma \times (4\pi R^2) \quad \frac{\text{N} \cdot \text{m}^2}{\text{m}} = \text{N} \cdot \text{m}$$

**Ex** One bubble is convert into 64 small bubble

Have to work req<sup>n</sup> to (work on system) (we) break bubble (big)

$$E_1 + W = E_2 \quad \Rightarrow \quad W = E_2 - E_1 \quad | \quad E_1 = E_2 - W$$

$$\rightarrow E_1 = \sigma \times 4\pi R^2$$

$$\rightarrow E_2 = 64\sigma \times 4\pi r^2$$

but  $V_1 = V_2 \Rightarrow \frac{4}{3}\pi R^3 = 64 \times \frac{4}{3}\pi r^3 \Rightarrow R = 4r$

$$W = 64\sigma \times 4\pi r^2 - \sigma \times 4\pi R^2 = 64\sigma \times 4\pi \left(\frac{R}{4}\right)^2 - \sigma \times 4\pi R^2$$

$$W = 4\pi R^2 \sigma [n^{2/3} - 1]$$

ES  
LATE-1C

total pressure 'B' inside air bubble @ 'h'

(i)  $\frac{4\rho}{d}$  (ii)  $\frac{4\rho}{d}$

(iii)  $\frac{4\rho}{d} + \rho gh$  (iv)  $\frac{4\rho}{d} + \rho gh$

→ as moving up, size increasing due to density of air is less

ES The maximum shear stress developed in lubricant oil having viscosity 0.981 poise, filled between two parallel plate & moving with velocity of 2 m/s is (2) which are 1 cm apart.

→  $\mu = 0.981 = 0.0981 \text{ N/m}^2$

$y = 0.01$

$v = 2$

$\tau = \mu \frac{dv}{dy} = 0.0981 \left( \frac{2}{0.01} \right)$

$\tau = 19.62 \text{ N/m}^2$

ES For a flow over flat plate, the velocity profile given by  $u = \frac{3}{4}y - y^2$ , then shear stress at a location 0.30 m above the plane is K times the shear stress at 0.2 m above the plane that  $K = (3)$

→  $u = \frac{3}{4}y - y^2 \Rightarrow \frac{du}{dy} = \frac{3}{4} - 2y$

$K = \frac{\tau_1}{\tau_2} = \frac{\mu \left( \frac{du}{dy} \right)_1}{\mu \left( \frac{du}{dy} \right)_2} = \frac{\frac{3}{4} - 2(0.3)}{\frac{3}{4} - 2(0.2)} = \frac{\frac{3}{4} - \frac{6}{10}}{\frac{3}{4} - \frac{4}{10}} = \frac{30 - 24}{30 - 16} = \frac{6}{14} = \left[ \frac{3}{7} \right] = K$

Q4 A lubricating oil with specific gravity of 0.88 & kinematic viscosity of  $\nu = 7.4 \times 10^{-7} \text{ m}^2/\text{s}$  filled bet<sup>n</sup> two parallel plates if the top plate is moving with velocity of 0.5 m/s while the bottom one is stationary assume the linear velocity variation over a gap of 0.5 mm between the plates the Max shear stress developed in Pa at the fixed plate is?

$$\nu = \frac{\mu}{\rho} \Rightarrow \mu = \nu \times \rho = 7.4 \times 10^{-7} \times 0.88 = 6.51 \times 10^{-7} \times 1000$$

$$\mu = 6.51 \times 10^{-4}$$

$$\tau = \mu \frac{dy}{dy} \Rightarrow \tau = 6.51 \times 10^{-4} \times \frac{0.5}{0.5 \times 10^{-3}} = 6.51 \times 10^{-1}$$

$$\tau = 0.651 \text{ N/m}^2 \leftarrow (\text{max.})$$

Q5

- parabolic → linear
- cubic → parabolic
- linear → const.

Thermodynamics or the 2nd law of Thermodynamics.

## Capillary

Cap. Rise	Cap. Fall
→ Adh > coh	→ coh > Adh ✓
→ $\theta < 90^\circ$	→ $\theta > 90^\circ$
→ Concave	→ Convex
Ex. Water, Alcohol	→ Ex. Hg...

$Adh > coh$

wetting

$$h_c = \frac{4\sigma \cos \theta}{\gamma d}$$

$coh > Adh$

non wetting

Proof:

$$F_{\uparrow} = F_{\downarrow} + W_{\downarrow}$$
$$[\sigma \cos \theta] L = \gamma \times Vol$$
$$\sigma \cos \theta \times \pi d = \gamma \times \frac{\pi d^2}{4} \times h_c$$

$$h_c = \frac{4\sigma \cos \theta}{\gamma d}$$

where  $\theta = 0$ , pure water & glass  
 $= 20^\circ$ , contaminated water & glass  
 $= 128^\circ$  - Hg - glass

Sp - case - (ii):

$$h_c = \frac{4\sigma \cos \theta}{\gamma (d_o - d_i)}$$

where  $\gamma$  = specific wt.

$$h_c = \frac{2rc \cos \theta}{yt}$$

NOTE: If  $h_c = 55 \text{ cm}$  ? it height is 50 cm then that is over flow

GATE '16 CIVIL: A shaft of 100 mm diameter is rotating inside a sleeve of 102 mm and 2000 rpm. The angular space is filled with lubricant of viscosity 5 poise. Calculate the power loss due to friction for sleeve length of 100 mm.

$$\mu = 5 \times 10^{-1} \frac{\text{Ns}}{\text{m}^2}$$

$$D = 0.5 \text{ m}$$

$$N = 2000 \text{ rpm}$$

$$y = \frac{d_2 - d_1}{2} = \frac{2}{2} = 1 \text{ mm}$$

$$V = \frac{\pi D N}{60}$$

$$P = \frac{2\pi NT}{60} \Rightarrow T = F \times d_1 = F \times R$$

$$\tau = \frac{F_{\text{friction}}}{A} = \mu \frac{dv}{dy} \Rightarrow F = (\pi d L) \mu \frac{dv}{dy}$$

$$= \pi \times 0.5 \times 0.1 \times 5 \times 10^{-1} \times \left( \frac{\pi \times 0.5 \times 2000}{60} \right)$$

$$= 41.08 \text{ N}$$

$$\rightarrow T = F \times R = 41.08 \times \frac{0.5}{2} = 10.27$$

$$\rightarrow P = \frac{2\pi \times 2000 \times 10.27}{60} = 2.14 \text{ kW}$$

NOTE

$$A = \pi dL$$

$$A = \frac{\pi d^2}{4}$$

Chemical end

$$A = \pi r^2$$

Surface area where pair is moving or if rubbing action happens

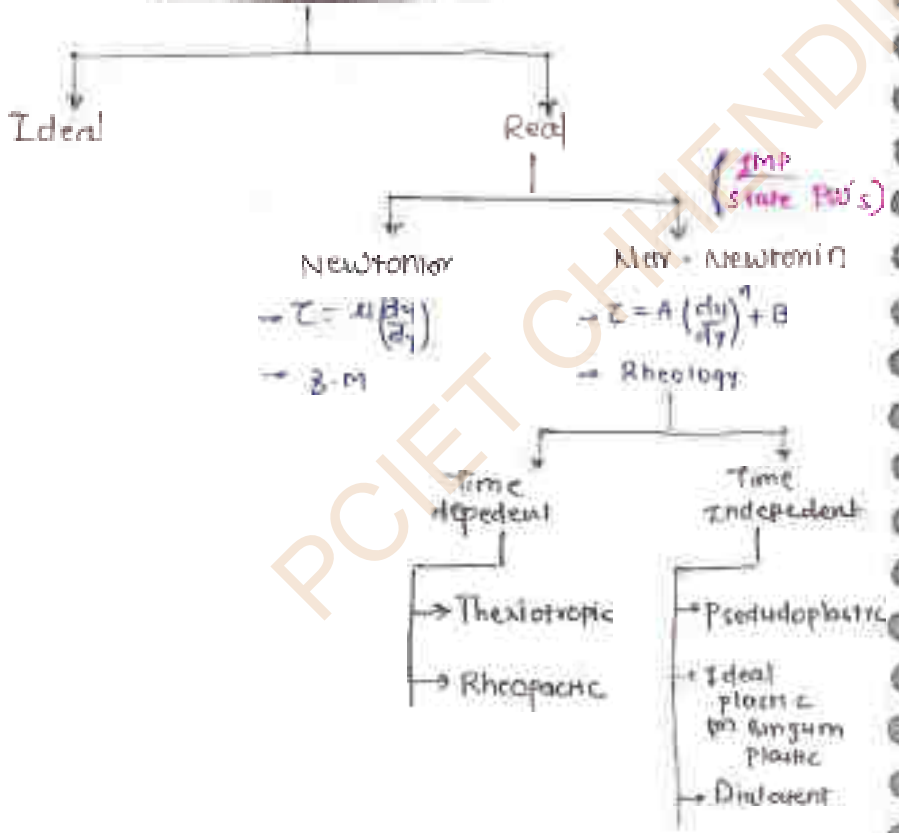

$$P_{\text{loss}} = \left( \frac{\mu AV}{y} \right) \cdot v \quad \frac{1}{2} \rho v^2$$

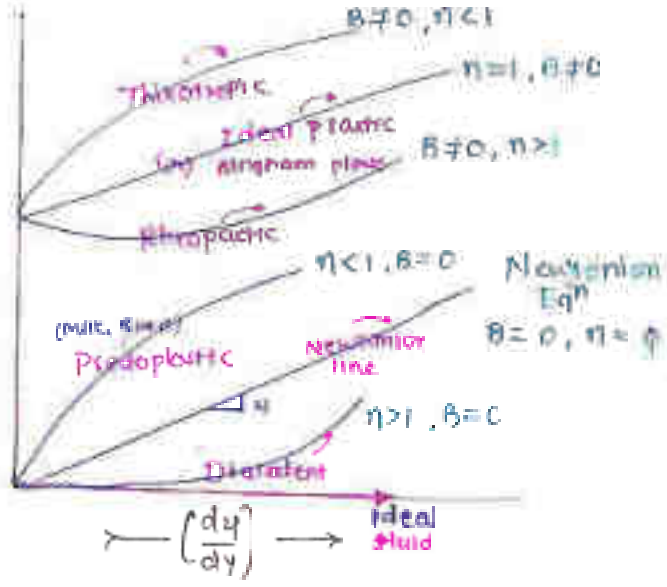

$$P_{\text{loss}} \propto \mu$$

Viscosity ( $\mu$ )  $\rightarrow$  poise (P)  
(centipoise)

### Classification of fluid

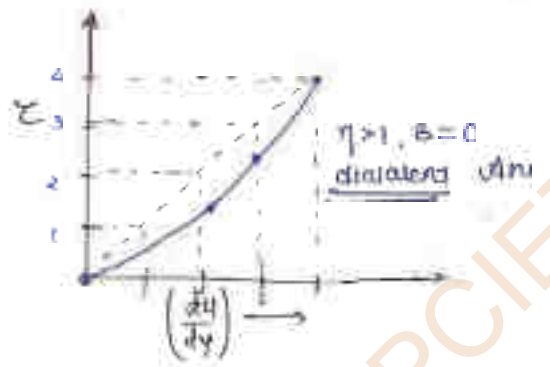

↑  
z  
↓

ES

z	c	1-2	3-3	4
$\tau/dy$	c	2	3	4

Examples of Non Newtonian

- 1) Pseudoplastic: ( $B=0, \eta < 1$ )  
Milk, Blood, pulp paper soil, Liq<sup>n</sup> cement
- 2) Ideal (or) Bingham plastic  
Drilling mud, sewage sludge, Dyach, toothpaste

NOTE : For shear thinning fluid, viscosity increases with increasing in time with [lapse of time].

Ex

$$F = A \tau = \mu \left( \frac{du}{dy} \right) A$$

$$130 \sin 22.61 = \mu \left( \frac{5}{0.0005} \right) \times 2 \Rightarrow \mu = 0.0023 \quad \boxed{\mu = 5 \times 10^{-3} \frac{Ns}{m^2}} = 5 \text{ cP}$$

F<sub>pull</sub> (N)

$$F_{pull} = W \sin \theta + \frac{\mu A U}{y}$$

$$= 130 \sin 22.61 + \frac{5 \times 10^{-3} \times 1 \times 5}{5 \times 10^{-4}}$$

$$\boxed{F_{pull} = 100 \text{ N}}$$

→ Methods to find Viscosity :

① Newtonian Equation

$$\tau = \mu \left( \frac{du}{dy} \right)$$

Tip

② Hazen Poiseuille's Equation

$$Q = \left( \frac{-\partial P}{\partial x} \right) \frac{\pi R^4}{8 \mu L} = \frac{(P_1 - P_2) \pi R^4}{128 \mu L}$$

3) Stokes' Equation :

(In Stokes eq<sup>n</sup> we consider only  $F_G, F_p, F_v$  are considered)

$$\text{Velocity} = \frac{g d^2 (\rho_s - \rho_f)}{18 \mu}$$

GATE  
CIVIL

A circular disc of diameter  $d$  was rotating above the fixed surface of channel fluid, uniform torque required to maintain angular velocity  $\omega$  is

~~$$T = F_{\text{shear}} \times \text{dist}$$

$$= F \times R$$

$$= \frac{4 \mu A V}{h} \times R$$~~

Here ;  $\mu = \mu$   
 $A = \pi r^2$   
 $V = r \cdot \omega$   
 $h = h$

~~$$= \frac{4 \pi r^2 (r \omega)}{h} \times R$$~~

~~$$T = \frac{16 \mu \omega R^4}{h}$$~~

(Here we can't divide by that type because velocity at different points is varies on disc so to take integration)

$$T = \int dT = \int dF \times r$$

$$= \int \left( \frac{4 \mu dA V}{h} \right) r = \int_{r=0}^R \frac{4 \mu (2\pi r dr) (r \omega)}{h} r$$

$$= \frac{8 \pi \mu \omega}{h} \int_0^R r^3 dr = \frac{2 \pi \mu \omega}{h} \left[ \frac{r^4}{4} \right]_0^R$$

$$T = \frac{16 \mu \omega R^4}{3h} \quad \text{Ans. (a)} \quad T = \frac{16 \mu \omega R^4}{3h}$$

→ For derivation of w/o integrating the answer is half of the answer from w/o integration beam

## Hydrostatics

→ Hydrostatic Law :

shapes don't matter Height eq<sup>d</sup> (verticals) (measured from verticals)

Hydrostatic Condition (Pascal's Law)

$\underline{p}$  pressure force equally propagated in all three directions (xxx) only in static condition

### Hydrostatic

$$\sigma_x = \sigma_y = \sigma_z = \sigma$$

$$\tau_{xy} = 0$$

$$\text{for 2-D} \Rightarrow \sigma_x = \sigma_y = \sigma$$

$$\tau_{xy} = 0$$

GATE 05 For static condition

Shear stress = 0

Normal stress =  $\sigma$

### Mohr's Circle:

$$\text{Radius} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} \Rightarrow R = \sqrt{\left(\frac{\sigma - \sigma}{2}\right)^2 + 0} = 0$$

$$\text{center} = \left[\frac{\sigma_x + \sigma_y}{2}, 0\right] \Rightarrow C = \left[\frac{\sigma + \sigma}{2}, 0\right] = \underline{[-\sigma, 0]}$$

### Atmospheric Condition:

- $P_{\text{atm}} = 1 \text{ atm}$  ✓
- $= 1.01325 \text{ bar}$  ✓
- $= 1.01325 \times 10^5 \text{ N/m}^2$  ✓
- $= 760 \text{ mm of Hg}$  ✓
- $= 10.3 \text{ m of water}$  ✓
- $= 34 \text{ feet}$  ✓

M.S.L. (Mean Sea Level)

$$1 \text{ ton} = 1 \text{ mm of Hg}$$

pressure exerted by 10.3 m water is same as p exerted by 0.760 m Hg is 1.01325 bar.

Explanation:  $P = \rho gh = 1.013 \times 10^5 \text{ N/m}^2$

$\rightarrow h_{\text{m of water}} = \frac{1.013 \times 10^5}{\rho_w \times g} = \frac{1.013 \times 10^5}{1000 \times 9.81} \approx 10.3 \text{ m of water}$

$\rightarrow h_{\text{m of Hg}} = \frac{1.013 \times 10^5}{\rho_{\text{Hg}} \times g} = \frac{1.013 \times 10^5}{13600 \times 9.81} \approx 760 \text{ mm of Hg}$

$\rightarrow h_{\text{m of oil, } s=0.8} = \frac{1.013 \times 10^5}{0.8 \times 1000 \times 9.81} \approx 12.8 \text{ m of oil, } s=0.8$

Ex 9 500 mm of Hg \_\_\_\_\_ m of water

$\approx \left[ \frac{1.013 \times 10^5}{760} \right] \times 500 \text{ N/m}^2$

$\approx \left[ \frac{10.3}{760} \right] \times 500 \text{ m of water}$

$\Rightarrow$  Gauge pressure ( $P_g$ ) :-

- pressure measured above base atmosphere

+ve  $P_g$

$\Rightarrow$  Vacuum pressure ( $P_v$ ) :-

- below atmosphere

-ve  $P_v$

- suction pressure

$\Rightarrow$  Absolute pressure ( $P_{abs}$ )

$P_{abs} = P_{atm} + P_g - P_v$

NOTE  $\rightarrow$  The pressure of atmosphere in which the gauge is located

FIG 11.10 Gauge Pressure in Water

ES

A cylindrical container contains water to a height of 10 cm above that mercury is added to ht. of 2 cm then the pressure at the interface of equilibrium

$$P_B = \rho_1 g h_1$$

$$= 13600 \times 9.81 \times 0.02$$

Note Hg have Higher density so.

$$P_A = \rho_2 g h_2$$

$$= 1000 \times 9.81 \times 0.1$$

$$= 981 \text{ N/m}^2$$

NOTE

$\rho_1 > \rho_2$

$$P_A = P_{atm}$$

$$P_B = P_A + \rho_2 g h_2$$

$$P_C = P_B + \rho_1 g h_1$$

$$= P_A + \rho_2 g h_2 + \rho_1 g h_1$$

$$\rho_1 > \rho_2$$

GATE CIVIL

A pressure gauge reads 57.4 kPa at 80 kPa respectively and heights of 5 m & 5 m then fixed on side of tank filled with liquid then approximate density of liquid will be

$$P_1 = 57.4 \times 10^3 \text{ N/m}^2$$

$$P_1 = \rho g h_1, \quad P_2 = \rho g h_2$$

$$P_2 - P_1 = \rho g h_2 - \rho g h_1$$

$$\text{So } 57.4 = \rho g (h_2 - h_1) = \rho g (8 - 5)$$

$$\frac{22600}{9.81 \times 3} = \rho$$

$$\rho = 767.7 \text{ kg/m}^3$$

Q.11

$P_1 = 5.0 \text{ bar}$   
 $P_2 = 2.0 \text{ bar}$   
 $P_{\text{atm}} = 1.01 \text{ bar}$   
 $P_{\text{abs}} = ?$

$\rightarrow P_{\text{abs}} = P_{\text{atm}} + P_{g1}$

$[P_{\text{atm}}]_{\text{abs}} = P_{\text{atm}} + P_{g2}$   
 $= 1.01 + 2.0$   
 $= 3.01$

$\rightarrow P_{\text{abs}} = 3.01 + 5.0$   
 $= 8.01 \text{ bar}$

ES

Std. atm. pressure 760 mm of mercury at a specific location barometer reads 700 mm of Hg, what does an absolute pressure of 380 mm of Hg at this location refer to?

$\rightarrow P_{\text{abs}} = P_{\text{atm}} + P_{\text{gauge}}$   
 $380 = 700 + P_{\text{gauge}}$

$P_v = -320 \text{ mm of vacuum}$

If  $P_v$  is negative then vacuum  
 $P_g$  is positive then gauge

ES

Density of sea water varies with depth of  $P = \rho_0(z+h)$ , then the pressure of depth of  $H$  from the free surface will be?

$\rightarrow \int dp = \rho_0 g dz$   
 $P = \rho_0(z+h)$  given  
 $P = \rho_0(z+h) + \rho_0 g H$   
 $= \rho_0 g z + (\rho_0 g H)^2$

$$P = \int dp = \rho_0 \int (1+h) g dh$$

$$P = \int_{h=0}^H \rho_0 (1+h) g dh = \rho_0 g \left[ h + \frac{h^2}{2} \right]_0^H$$

$$= \rho \int h da$$

$$= \rho \int k da$$

$$\boxed{F = \gamma A \bar{x}}$$

$$\int y da = A \bar{x}$$

$$\int y^2 da = I_G + A(\bar{x})^2$$

$$\boxed{\bar{h} = \bar{x} + \frac{I_G}{A \bar{x}}}$$

Where:  $I_G$  = moment of inertia about centroid

Moment of inertia: ( $I_G$ )

③ Inclined plane

$$F = \gamma A \bar{x}$$

$$\bar{R} = \bar{x} + \frac{I_p \sin^2 \theta}{A \bar{x}}$$

ES-15) An open rectangular container with  $L \times B \times H = 2 \times 2 \times 1$  was completely filled with water. The ratio of hydrostatic force acting at bottom face to force acting on any one of its larger vertical face is:

$$\frac{F_b}{F_v} = ?$$

$$F_b = \gamma A \bar{x}$$

$$F_b = 2 \gamma \omega$$

$$F_v = \gamma A \bar{x}$$

$$F_v = \gamma A \bar{x}$$

$$= \gamma \omega \times 2 \times \frac{1}{2}$$

$$F_v = \gamma \omega$$

$A_v = 2 \times 2$   
 $\bar{x} = \frac{1}{2}$

**QATE** A circular lamina of 1000 mm in diameter, was lying in water such that the distance of its perimeter measured vertically below the free surface is varying from 500 mm to 1200 mm. find  $F, \bar{h} = ?$

$$\rightarrow F = \gamma A \bar{x}$$

$$\gamma = \rho g = 9810 \text{ N/m}^3$$

$$A = \frac{\pi d^2}{4} = \frac{\pi}{4} \text{ m}^2$$

$$y = 500 + 500 = 1000$$

$$\bar{x} = 0.85$$

$$F = 9810 \times \frac{\pi}{4} \times 0.85$$

$$\boxed{F = 6.54 \text{ kN}}$$

$$h = \bar{x} + \frac{I_G \sin^2 \theta}{A \bar{x}}$$

$$= 0.85 + \frac{(\frac{\pi \times 1^4}{64}) \sin^2 \theta}{\frac{\pi \times 1^2}{4} \times 0.85}$$

$$\boxed{h = 0.866 \text{ m}}$$

**Q3** A vertical, rectangular dock gate of 2 m wide & 5 m height was closing a tunnel running full with water. The pressure at bottom of the gate is 195 kN/m<sup>2</sup>. The hydrostatic pressure acting = ?

$$\rightarrow F = \gamma A \bar{x}$$

$$A = 3 \times 5 = 15 \text{ m}^2$$

$$\bar{x} = \frac{5}{2}$$

$$\gamma = \gamma_{02}$$

$$F = \rho_w g A \bar{x}$$

$$= 1000 \times 9.81 \times 15 \times 2.5$$

$$= 36.825 \text{ MN}$$

Here 195 kN/m<sup>2</sup> at bottom given.

$$\bar{x} = 19.82 - 2.5 = 17.32$$

$$\bar{x} = h_g - z_c$$

$$19.82 = 9.81 h_g - 2.5$$

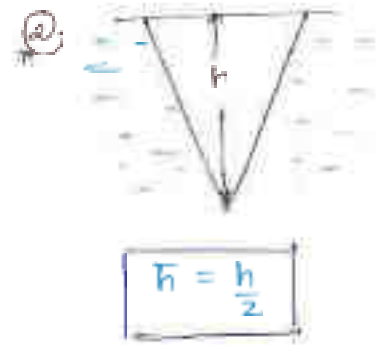

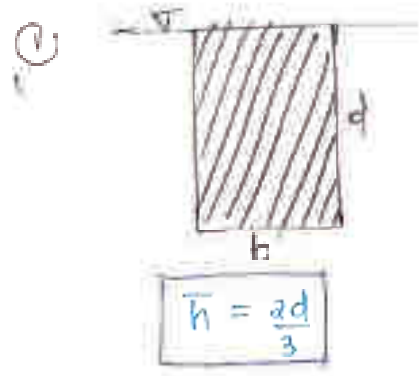

$$h_g = \frac{19.82 + 2.5}{9.81}$$

$$\boxed{h_g = 2.23 \text{ m}}$$

$$F = 9810 \times 7 \times 3 \times 17.32$$

$$\boxed{F = 2.83 \text{ MN}}$$

→ Standard cases of center of pressure

PCIET CHHENDIPADA

Ex. Rectangular container with equal vertical faces of  $L \times H$ , completely filled with water; i)  $F_{\text{bottom}} = F_{\text{vertical}}$   
 $L/H = 1/2$

$$F_{\text{bottom}} = F_B$$

$$F_B = \gamma A \bar{x}$$

$$= \gamma_w (L \times L) (H)$$

$$F_{\text{vertical}} = F_V$$

$$F_V = \gamma A \bar{x}$$

$$= \gamma_w (L \times H) (H/2)$$

$$F_B = F_V$$

$$\gamma_w (L \times L) H = \gamma_w (L \times H) (H/2)$$

$$\boxed{L/H = 1/2}$$

Ex

A semi-circular gate hinged along with diameter with water on its side as shown find the force required at point P to keep the gate vertically.

$$\sum M_p = 0$$

$$F_p \times 4 = F_H \times y$$

$$F_p \times 4 = (\gamma A \bar{x}) \times y$$

$$F_p = \frac{\gamma A \bar{x} y}{4}$$

$$\text{but } \bar{x} = \bar{x} + \left( \frac{I_G}{A \bar{x}} \right)$$

$$= 8.3 + \frac{0.085 \pi R^4}{\frac{\pi R^2}{2} \times 8.3}$$

$$\bar{x} = 8.43$$

$$\text{Now, } \gamma = 9810 \text{ N/m}^3 = \rho g$$

$$A = \frac{\pi R^2}{2} = \frac{\pi (4)^2}{2} \text{ m}^2$$

$$\bar{x} = \text{C.G. from free surface}$$

$$= 10 - \frac{4R}{\pi} = 10 - \frac{4 \times 4}{\pi} = 8$$

$$y = 10 - \bar{x}$$

$$= 10 - 8.43 = 1.57$$

$$I_G = 0.11 R^4$$

$$\text{SO, } F_p = \frac{9810 \times \frac{\pi (4)^2}{2} \times 8.3 \times 1.57}{4}$$

A vertical rectangular door gate of 2m wide remains in its position because of water of 3m in side. The gate weighs 600 kg & just sliding down started when the level of water from the bottom of the gate reaches to 4 m. Find  $\mu$ .

$$W = 4 \times 2 \times 4 \times \gamma_w = 64 \gamma_w$$

$$m_g = 21 (\gamma A \bar{x})$$

$$600 \times 9.8 = 21 (3 \times 1600) (A \times 2) (2)$$

$$\mu = \frac{1}{20} = 0.05$$

EM

A horizontal water tank in the shape of a cylinder with hemispherical end exactly half full with water find  $F_x/F_y = ?$  on one its hemispherical end.

Hem

$$F_y = \text{wt. of } 2 \times 1/4 \text{ in } \text{imagined}$$

$$= \gamma_w \times \text{Vol}^m$$

$$= \gamma_w \times \frac{1}{4} \left[ \frac{4}{3} \pi r^3 \right] = \gamma_w \times \frac{1}{3} \pi r^3$$

$$F_x = \gamma A \bar{x}$$

$$= \gamma_w \times \frac{1}{2} \pi r^2 \times \frac{4}{3} r$$

$$\therefore \frac{F_x}{F_y} = \frac{\frac{1}{2} \pi r^2 \times \frac{4}{3} r}{\frac{1}{3} \pi r^3} = \frac{4}{r}$$

Horizontal plane

$$\tan \theta = \left( \frac{h_1 - h_2}{L} \right) = \frac{\alpha_x}{g}$$

Interview pt:

Inclined plane

$$\alpha_x = \alpha \cos \theta$$

$$\alpha_y = \alpha \sin \theta$$

$$\tan \theta = \frac{\alpha_x}{g \pm \alpha_y}$$

Vertical plane (Motion of GH of Elevator)

$$P = \rho g h \left[ 1 \pm \frac{\alpha_y}{g} \right]$$

NOTE: If the container moving horizontally with acceleration  $a_x$  downwards  $(a_x = g)$  pressure at any point will be zero

$$p = \rho gh \left[ 1 \pm \frac{a_x}{g} \right] = \rho gh \left[ 1 - \frac{g}{g} \right] = 0$$

$$P_A = P_B = P_C = P_{atm}$$

$$p = \rho gh \left[ 1 - \frac{a_x}{g} \right] = 0 \quad (a_x = g)$$

but localise pressure <sup>const</sup>  $\frac{p}{\rho g} + \frac{V^2}{2g} = C$

$$\frac{p}{\rho g} + \frac{V^2}{2g} = C$$

Free

ISRO: Acceleration required to cause the free surface of liq<sup>n</sup> in container moving on horizontal track to dip by  $45^\circ$  is  $\beta$

$$\tan \theta = \frac{a_x}{g} \rightarrow \tan 45^\circ = \frac{a_x}{g}$$

$$\boxed{a_x = g}$$

ISRO: open rectangular container with base area  $2 \times 3 \text{ m}^2$  is filled with liq<sup>n</sup>  $\rho = 8000 \text{ kg/m}^3$  & a height of  $0.6 \text{ m}$  & is accelerated an upward acceleration  $4.9 \text{ m/s}^2$  pressure at container at bottom will be  $\tau$

$$P = \rho gh \left[ 1 \pm \frac{a_x}{g} \right] \quad a_x \uparrow$$

$$= 8000 \times 9.81 \times 0.6 \left[ 1 + \frac{4.9}{9.8} \right]$$

$$\boxed{P = 15.8 \text{ kPa}}$$

ES: A open cubical container, completely filled with water is accelerated on a horizontal plane along one of its side find the uniform acc<sup>n</sup>, such that  $\frac{1}{8}$  vol<sup>n</sup> of water has been spilled out  $\rightarrow$

(1)

$$\tan \theta = \frac{h_1 - h_2}{L} = \frac{\alpha_x}{g}$$

$$\alpha_x = \left( \frac{s - h_2}{s} \right) \cdot g$$

$$\text{Vol}^m \text{ spilled} = \frac{1}{3} (s^3)$$

$$\frac{1}{2} (s)(s-h_2)(s) = \frac{1}{3} (s^3)$$

$$s - h_2 = \frac{2}{3} s$$

$$h_2 = \frac{s}{3}$$

$$\tan \theta = \frac{h_1 - h_2}{L} = \frac{s - s/3}{2s} = \frac{2s/3}{2s} = \frac{\alpha_x}{g}$$

$$\boxed{\alpha_x = \frac{2g}{3}}$$

(2)  $\frac{1}{2}$  of vol<sup>m</sup> spilled out ;  $\alpha = 0$ 

$$\tan 45^\circ = \frac{\alpha_x}{g}$$

$$\boxed{\alpha_x = g}$$

(3)  $\frac{4}{9}$  of vol<sup>m</sup> spilled out ;  $\alpha = 18^\circ$ 

$$\text{Vol}^m \text{ spilled} = \frac{2}{9} (s^3)$$

$$\tan \theta = \frac{h_1 - h_2}{L} = \frac{\alpha_x}{g}$$

$$= \frac{s - 0}{L} = \frac{\alpha_x}{g}$$

$$\text{Remaining water} = \frac{1}{3} (s^3)$$

$$\frac{1}{2} L \times s \times s = \frac{1}{3} s^3 \Rightarrow L = \frac{2}{3} s$$

$$\alpha_x = \left( \frac{s}{2} \right) g = \left( \frac{5g}{23} \right) g$$

$$\boxed{\alpha_x = \frac{5g}{23}}$$

PCIET CHHENDIPADA

Liquid in Rotation

→ Vortex flow

Forced Flow

Free Flow

① Rotation is possible by providing external energy

②  $V \propto R$   
 $\therefore V = R\omega = R \frac{2\pi N}{60}$   
 $V = \frac{\pi DN}{60}$

③ Rotational flow

eg. flow of water in turbine or centrifugal pump  
 ↓  
 within runner      within impeller

$$z = \frac{V^2}{2g}$$

$$z = \frac{R^2 \omega^2}{2g}$$

⇒ Vol<sup>m</sup> spilled = Vol<sup>m</sup> paraboloid =  $\frac{1}{2} \pi R^2 H$

for cylinder =  $\pi R^2 H$

for cone =  $\frac{1}{3} \pi R^2 H$

for paraboloid =  $\frac{1}{2} \pi R^2 H$

① Rotation is possible by conservation of angular momentum

②  $V \propto 1/R \Rightarrow V = \omega R$

③ Irrotational flow  
 within cone - IR } forced flow  
 outside cone - R

eg. flow of water - water basin whirlpool.  
 flow of water in turbine after leaving runner & in pump after leaving impeller

What will be the maximum speed upto which water will not spill out?

$$z = \frac{R^2 \omega^2}{2g}$$

$$z = \frac{R^2 \omega^2}{2g}$$

$$\omega^2 = \frac{2g \times 10}{R^2}$$

$$\omega = 8.72 \text{ rad/s}$$

$$N = \frac{8.72 \times 60}{2\pi} \Rightarrow \boxed{N = 83.26 \text{ RPM}}$$

Q) An open cylinder contains of 30 cm diameter & 30 cm height was completely filled with water (liquid) find the amount of liquid spilled out when it is rotating about its axis at (a) 100 rpm (b) 200 rpm

- Vol<sup>m</sup> of liquid spilled = Vol<sup>m</sup> of paraboloid =  $\frac{1}{2} \pi R^2 z$

(i)

$$\text{but } z = \frac{R^2 \omega^2}{2g} = \frac{(0.15)^2}{2 \times 9.81} \left( \frac{2\pi \times 100}{60} \right)^2$$

$$z = 0.407$$

$$V = \frac{1}{2} \pi R^2 z = \frac{1}{2} \times \pi \times (0.15)^2 \times 0.407$$

$$\boxed{V = 0.0144 \text{ m}^3}$$

Amount of spilled = 14.4 liter

(ii)

$$z = \frac{R^2 \omega^2}{2g} = \frac{(0.15)^2}{2 \times 9.81} \left( \frac{2\pi \times 200}{60} \right)^2$$

$$= 0.7243 = 72.43 \text{ cm} > 30 \text{ cm} \text{ (So directly water will spill out)}$$

$$V = \frac{1}{2} \pi R^2 z = \frac{1}{2} \times \pi \times (0.15)^2 \times 0.7243 = 0.06$$

$$\text{Vol}^m \text{ of ABCDE} = 0.06 \text{ m}^3$$

- Vol<sup>m</sup> of paraboloid ABC,

$$V_2 = \frac{1}{2} \pi R_2^2 z_2$$

$$0.06 = \frac{1}{2} \pi (0.15)^2 (0.7243 - 0.5) = 0.225$$

$$z_2 = \frac{R_2^2 \omega^2}{2g} \Rightarrow R_2^2 = \frac{(2 \times 9.81 \times 0.225) (60)^2}{(2\pi)^2}$$

$$\boxed{R_2 = 0.683 \text{ m}}$$

$$V_2 = \frac{1}{2} \pi R_2^2 z_2 = \frac{1}{2} \times \pi \times (0.683)^2 \times (0.225) = 0.0244 \text{ m}^3$$

$$\text{Amount spilled} = V_1 - V_2$$

$$= 0.06 - 0.0244$$

$$= 0.0356 \text{ m}^3$$

mm radius may completely filled with water & rotated about its axis find the uniform speed of rotation such that  $\frac{1}{3}$ rd area of base gets exposed.

→  $\frac{1}{3}$ rd area of circle exposed that means

$$\pi R^2 = \frac{1}{3} \pi R^2$$

$$R^2 = \frac{R}{\sqrt{3}} = \frac{0.06}{\sqrt{3}} = 0.0461 \text{ m}$$

$$\omega^2 = \frac{(R^2 - R^2) \omega^2}{2g}$$

$$\omega^2 = \frac{0.2 \times 25.98}{(0.06)^2 - (0.0461)^2} = 917.93 = \frac{2\pi N}{60}$$

$$N = 269.34 \text{ rpm}$$

IAS] A right circular conical container with its apex downwards  $\frac{2}{3}$  axis vertical way exactly half full find the speed of rotation about its axis when the water is about to spill for radii of 1.5 m.

$$z = \frac{R^2 \omega^2}{2g}$$

→ Vol<sup>m</sup> of paraboloid =  $\frac{1}{2}$  (Vol<sup>m</sup> of cone)

$$\frac{1}{2} \pi R^2 z = \frac{1}{2} \times \frac{1}{3} \pi R^2 H$$

$$\left[ z = \frac{H}{3} \right] = R/3 \quad (\theta = 45^\circ)$$

$$\tan 45^\circ = R/H$$

$$\omega^2 = \frac{R^2 \omega^2}{2g}$$

$$\omega^2 = \frac{2g \times R/3}{R^2} = \frac{2g}{3R} = \frac{2 \times 9.81}{3 \times 1.5} = 4.26$$

$$\frac{2\pi N}{60} = \omega = 2.06$$

$$N = \frac{2.06 \times 60}{2\pi}$$

$$N = 19.93 \text{ rpm}$$

→ Fundamental of fluid flow:

① Steady & unsteady flow

- If all the property doesn't vary w.r.t time then the flow is said to be steady flow

If single property changes with respect to time it will be considered as unsteady flow

property =  $f(\text{space, time}) = f(x, y, z, t)$

→  $\frac{\partial P}{\partial t} = 0$   $\Rightarrow$  steady (All the property w.r.t time zero)

→  $\frac{\partial P}{\partial t} \neq 0$   $\Rightarrow$  unsteady (Even single property varies)

② Uniform & Non uniform flow

→  $\frac{\partial P}{\partial s} = 0$   $\Rightarrow$  uniform (i.e.  $\frac{\partial P}{\partial x}, \frac{\partial P}{\partial y}, \frac{\partial P}{\partial z} = 0$ )

→  $\frac{\partial P}{\partial s} \neq 0$   $\Rightarrow$  Non uniform

eg

$Q = AV$

As area decrease, velocity increase & vice versa

$\frac{\partial P}{\partial s} \neq 0$

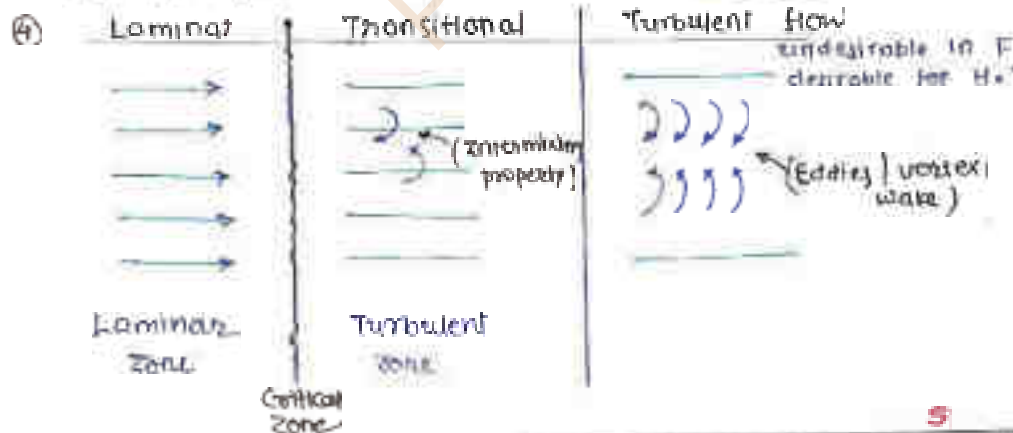

$\Rightarrow$  non uniform flow.

but we can't give the answer about steady & unsteady because to find all property need to be checked.

③ Compressible & Incompressible flow

- Gas is compressible & liq<sup>n</sup> is incompressible  $\rightarrow \rho = \text{const}$

- eqy can give incompressible when  $M < 0.3$

- If the fluid particles rotate about their mass centres while moving forward, then the flow is said to be rotational otherwise irrotational.

**NOTE:** ① Rotational is because of variation in speed, i.e. difference in velocity of adjacent layer.

→ If  $\omega_x, \omega_y, \omega_z = 0$  then irrotational  
 $\omega_x, \omega_y, \omega_z \neq 0$  then rotational

→ Velocity & Acceleration:

$$V = \vec{V}(x, y, z, t)$$

$$V \begin{cases} x \rightarrow V_x = u \rightarrow a_x \\ y \rightarrow V_y = v \rightarrow a_y \\ z \rightarrow V_z = w \rightarrow a_z \end{cases}$$

$$\text{Velocity} = \frac{\text{dist}^h}{\text{time}}$$

$$\text{Acc.} = \frac{\Delta \text{Velocity}}{\text{time}}$$

$$\text{Jerk} = \frac{\Delta \text{Acc}^n}{\text{time}}$$

$$\text{so, } \vec{V} = V_x \bar{i} + V_y \bar{j} + V_z \bar{k}$$

$$\vec{a} = a_x \bar{i} + a_y \bar{j} + a_z \bar{k}$$

$$\text{so, } V_x = \frac{dx}{dt}; V_y = \frac{dy}{dt}; V_z = \frac{dz}{dt} = a$$

we can't directly give  $u = \frac{dx}{dt}$  bcoz one particle move from one corner to another is moving  $x, y, z, t$

$$a_x = \frac{du}{dt}; a_y = \frac{dv}{dt}; a_z = \frac{dw}{dt}$$

$$\text{so, } u = \vec{u}(x, y, z, t)$$

$$v = \vec{v}(x, y, z, t)$$

$$w = \vec{w}(x, y, z, t)$$

$$a_x = \frac{du}{dt} = \frac{\partial u}{\partial x} \left( \frac{dx}{dt} \right) + \frac{\partial u}{\partial y} \left( \frac{dy}{dt} \right) + \frac{\partial u}{\partial z} \left( \frac{dz}{dt} \right) + \frac{\partial u}{\partial t}$$

**NOTE** →

$$a_x = u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} + \frac{\partial u}{\partial t}$$

$$a_y = u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} + \frac{\partial v}{\partial t}$$

$$a_z = u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} + \frac{\partial w}{\partial t}$$

time

$$V = V_1 + V_2 \Rightarrow \dots$$

$$\alpha_{total} = \alpha_{convective} + \alpha_{local} (temporal)$$

$\{x, y, z\}$ 
 $\{t\}$

for static fluid  $\alpha_{local} = 0$

→ for E-D:

$$\text{so, } v_s = \frac{ds}{dt} \quad ; \quad v_n = \frac{dn}{dt}$$

$$\alpha_s = \frac{dv_s}{dt} \quad ; \quad \alpha_n = \frac{dv_n}{dt}$$

also  $v_s, v_n = f[s, n, t]$

$$\alpha_s = \frac{\partial v_s}{\partial s} \left( \frac{ds}{dt} \right) + \frac{\partial v_s}{\partial n} \left( \frac{dn}{dt} \right) + \frac{\partial v_s}{\partial t}$$

$$\alpha_s = v_s \frac{\partial v_s}{\partial s} + v_n \frac{\partial v_s}{\partial n} + \frac{\partial v_s}{\partial t}$$

$$\times \alpha_n = v_s \frac{\partial v_n}{\partial s} + v_n \frac{\partial v_n}{\partial n} + \frac{\partial v_n}{\partial t}$$

$$\alpha_s = \alpha_{convective} + \alpha_{local}$$

→ Continuity Equation

→ Conservation of mass →

m = mass flow rate is constant

$$\dot{m} = \frac{\text{mass}}{\text{time}} = \text{const} \Rightarrow \frac{kg}{s} = \text{const}$$

$$\dot{m} = \frac{kg}{s} \times \frac{m^3}{m^3} = \frac{kg}{s} \cdot \frac{m^3}{sec} = \frac{kg}{s} \cdot \frac{m^3}{A \cdot v} = \text{const}$$

$$\dot{m} = \rho Q = \rho A V = \text{const}$$

→ For incompressible flow,  $\rho$  is const

$$A_1 V_1 = A_2 V_2$$

Cont. 9"

$$\frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} + \frac{\partial \rho}{\partial t} = 0$$

conservation of mass

→ for steady flow  $\left[ \frac{\partial \rho}{\partial t} = 0 \right]$  (The flow doesn't change w.r.t time)

→ for incompressible flow  $\Rightarrow \rho = \text{const}$

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0$$

→ For 2-D flow

$$\nabla \cdot \vec{V} = 0 \quad \text{or} \quad \left[ \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \right] \quad (\text{incompressible 2-D flow})$$

\*  $\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \rightsquigarrow$  incompressible ( $\rho = \text{const}$ )

\*  $\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \neq 0 \rightsquigarrow$  compressible

GATE 2003

$\vec{V} = 2y\mathbf{i} + 3x\mathbf{j}$  the convective accel in x direction at point (1,1) = ?

$$\vec{V} = 2y\mathbf{i} + 3x\mathbf{j}$$

$$v_x = 2y = \frac{dx}{dt} \quad v_y = 3x = \frac{dy}{dt}$$

$$a_x = \frac{dv_x}{dt} = \frac{\partial v_x}{\partial x} \left( \frac{dx}{dt} \right) + \frac{\partial v_x}{\partial y} \left( \frac{dy}{dt} \right)$$

$$= (0)(2y) + (2)(3x)$$

$$= 6x \quad \text{at } (1,1)$$

$$\boxed{a_x = 6} \quad \text{convective}$$

Ex for 2-D incompressible flow x-component of velocity  $u = c \ln(xy)$  the  $v = ?$

$$\frac{\partial u}{\partial x} = c \cdot \frac{1}{xy} \cdot (1)y = \frac{c}{x}$$

$$\frac{\partial v}{\partial y} = -\frac{c}{x} \quad \text{but for } \nabla \cdot \vec{V} = 0 \quad \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

$$dv = -\frac{c}{x} dy$$

$$\boxed{v = -c \left( \frac{y}{x} \right)}$$

ES:

$$u = \lambda xy^3 - x^2y$$

$$v = xy^2 - \frac{3}{4}y^4$$

What value of  $\lambda = ?$

$$\frac{\partial u}{\partial x} = \lambda(y^3) - 2xy \quad \& \quad \frac{\partial v}{\partial y} = 2xy - \frac{3}{4}(4y^3)$$

$$= 2xy - 3y^3$$

$$\lambda y^3 - 2xy + 2xy - 3y^3 = 0 \quad \text{for incompressible}$$

$$\lambda = 3$$

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

ES-06

$$\vec{V} = (5x + 6y + 7z)\vec{i} + (3x + 5y + 4z)\vec{j} + (2x + 3y + \lambda z)\vec{k}$$

where  $\lambda = \text{const} = ?$

In order that mass is conserved. (incompressible)

density varies  $\rho = \rho_0 e^{-2t}$

comp = unsteady

$$\rho = \rho_0 e^{-2t} \Rightarrow \frac{\partial \rho}{\partial t} = \rho_0 \frac{e^{-2t}}{e^2} (-2) = -2\rho_0 e^{-2t} = -2\rho$$

$$\frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} + \frac{\partial \rho}{\partial t} = 0$$

$$\rho \frac{\partial(5x+6y+7z)}{\partial x} + \rho \frac{\partial(3x+5y+4z)}{\partial y} + \rho \frac{\partial(2x+3y+\lambda z)}{\partial z} + (-2\rho) = 0$$

$$\rho(5) + \rho(5) + \rho(\lambda) = 2\rho$$

$$\lambda = -8$$

→ Here density varies so,  $\rho = \rho_0 e^{-2t}$  so, compressible  
→ Even single property change with time then unsteady

GATE -03/15

The continuity eq<sup>n</sup>  $\nabla \cdot \vec{V} = 0$  to be valid which of following necessary cond<sup>n</sup>

- (i) Steady
- (ii) unsteady
- (iii) comp
- (iv) Incomp

$$\frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} + \frac{\partial \rho}{\partial t} = 0$$

$$\text{for steady } \frac{\partial(\rho)}{\partial t} = 0 \Rightarrow \frac{\partial \rho}{\partial t} = 0$$

so will not  $\nabla \cdot \vec{V} = 0$

$$\nabla \cdot \vec{V} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z}$$

for incomp ;  $\rho = \text{const.}$

$$\rho \left[ \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} \right] + \frac{\partial(\text{const})}{\partial t} = 0$$

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0$$

- If fluid is incompressible then it may be steady / unsteady.
- If fluid steady then it must be incompressible.

Steady

→ but if fluid is incompressible then it must be steady (or) unsteady both incompressible

- i.e.  $\rightarrow S = \text{const}$  but we can not say w.r.t time it is not change density so it may be steady or unsteady

GATE-05

The gap bet<sup>n</sup> a moving circular plate and stationary surface is being continuously reduced as circular plate comes down with uniform velocity  $v$

as shown; Assuming the fluid in between is incompressible and it was slowing out radially.

(1) The radial velocity  $v_r$  at any radius ' $r$ '. When gap width is ' $h$ ' (2)

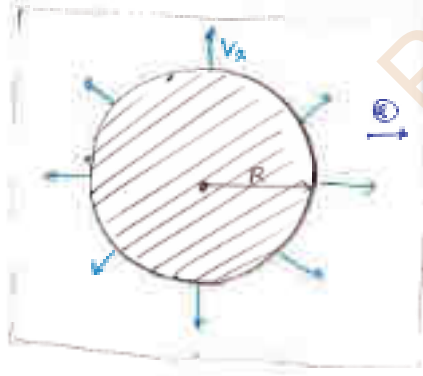

- (a)  $\frac{v r}{h}$     (b)  $\frac{v h}{2 r}$     (c)  $\frac{2 v r}{R}$     (d)  $\frac{v h}{R}$

(2) Radial component of acceleration at  $r = R$

- (a)  $\frac{v^2 R}{2 h^2}$     (b)  $\frac{v^2 R}{4 h^2}$     (c)  $\frac{3 v^2 R}{2 h^2}$     (d)  $\frac{3 v^2 R}{4 h^2}$

Velocity	$v$	$\frac{v}{2}$
Area	$\pi r^2$	$2\pi r h$

(1)  $A_1 V_1 = A_2 V_2$

$\pi r^2 v = v_r (2\pi r h)$

$v_r = \frac{v r}{2 h}$

$$(2) v_A = \frac{dv_A}{dt} = \frac{v_A}{dt} \Rightarrow v_A = \frac{v_A}{dt}$$

•  $h = \text{const}$ ;

$$\alpha_A = \frac{dv_A}{dt} = \frac{d}{dt} \left[ \frac{v_A}{2h} \right] = \frac{v_A}{2h} \left[ \frac{dh}{dt} \right]$$

$$= \frac{v_A}{2h} \cdot v_A = \frac{v_A}{2h} \left[ \frac{v_A}{2h} \right]$$

$$\alpha_A = \frac{v_A^2}{4h} \Rightarrow \text{at } h = R$$

$$\alpha_A = \frac{v_A^2}{4R}$$

•  $h = \text{variable}$ ;

$$\alpha_A = \frac{dv_A}{dt} = \frac{d}{dt} \left[ \frac{v_A}{2h} \right] =$$

$$v = f(x, h, t)$$

$$v \begin{cases} \rightarrow s \rightarrow v_s \rightarrow \alpha_s \\ \rightarrow h \rightarrow v_h \rightarrow \alpha_h \end{cases}$$

$$= v_A = \frac{dv_A}{dt} = \frac{v_A}{2h} \quad \& \quad v_h = \frac{dh}{dt} = -v$$

Height is decreasing so total velocity  $v$  changes at time  $t$  and  $h$  but height is decrease in direction

$$\alpha_A = \frac{dv_A}{dt}$$

$$\Rightarrow \alpha_A = \frac{d}{dt} \left[ \frac{v_A}{2h} \right] = \frac{\partial v_A}{\partial x} \left( \frac{\partial h}{\partial t} \right) + \left( \frac{\partial v_A}{\partial h} \right) \left( \frac{\partial h}{\partial t} \right) + \frac{\partial v_A}{\partial t}$$

$$= \frac{\partial}{\partial h} \left[ \frac{v_A}{2h} \right] \times \left[ \frac{v_A}{2h} \right] + \frac{\partial}{\partial h} \left[ \frac{v_A}{2h} \right] \cdot (-v) + \frac{\partial}{\partial t} \left[ \frac{v_A}{2h} \right]$$

$$= \frac{v_A}{2h} \left[ \frac{v_A}{2h} \right] + \frac{v_A}{2} \left( \frac{-1}{h^2} \right) (-v) + 0$$

$$= \frac{v_A^2}{4h} + \frac{v_A^2}{2h^2} (2)$$

$$\alpha_A = \frac{3v_A^2}{4h^2}$$

Ans) For a 2-D; 2-C. flow; X-component of velocity is  $v = Ae^{xy}$  the  $y = (1)$

$$\rightarrow \frac{dx}{dt} + \frac{dy}{dt} = 0$$

$$\frac{d}{dt} (Ae^{xy}) = -\frac{dy}{dt}$$

$$-Ae^{xy} dy = dx$$

$$\int v_x = -Ae^{xy} + f(t)$$

Here, you find const. before doing integration with  $y$  so  $x$  const.

- line  $\rightarrow$  direction
- function  $\rightarrow$  Magnitude

Tracing motion of different particles

It is imaginary curve drawn in flow field, such that the tangent to it at any point will give the direction of velocity at that point.

$$\rightarrow \tan \theta = \frac{dy}{dx} = \frac{v}{u}$$

Clope of stream line

$$\rightarrow \frac{dx}{u} = \frac{dy}{v} = \frac{ds}{Q}$$

for 3-D

$$v dx - u dy = 0$$

**NOTE:** The flow across a stream line will be zero

**NOTE:** Potential line ( $\Phi$ -line) will be orthogonal to stream line

$$m_{\phi} = -\frac{1}{m_{\psi}} = \left(-\frac{u}{v}\right) \quad \& \quad m_{\psi} = +\frac{v}{u}$$

$\rightarrow$  Line passing from  $(x_1, y_1)$  w/ slope  $m$  is  $[y - y_1] = m[x - x_1]$

$\rightarrow$  Path line - [Lagrangian Approach] (stream line)  
It is line traced by a single particle over a period of time

Tracing of any one fluid particle

$\rightarrow$  Streak line  
(or) filament line  
Identification

## → Rotation

Rotational velocity vector  
 $\vec{\omega} = \omega_x \hat{i} + \omega_y \hat{j} + \omega_z \hat{k}$

For z-D:

2D xy  $\rightarrow \omega_z = 0 \rightarrow$  irrotational (no rotation)  
 $\omega_z \neq 0 \rightarrow$  Rotational

$$\omega_z = \frac{1}{2} \left[ \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right]$$

$$\omega_x = \frac{1}{2} \left[ \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z} \right]$$

$$\omega_y = \frac{1}{2} \left[ \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x} \right]$$

$u$	$v$	$w$
$x$	$y$	$z$
$y$	$z$	$x$
$z$	$x$	$y$

$$\vec{\omega} = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ u & v & w \end{vmatrix}$$

## → Circulation

$$\text{Circulation (xy-plane)} = 2 \times \omega_z \times \text{Area}$$

$$\text{Circulation (xy)} = 2 \times \frac{1}{2} \left[ \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right] \times \text{Area} \quad (\text{Regular geometry})$$

$$\times \text{Circulation (xy)} = \iint_{y,x} \left[ \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right] \times \text{Area} \quad (\text{Irregular geometry})$$

## → Vorticity $(\vec{\omega} \text{ or } \vec{\zeta})$

$$\text{Vorticity (xy-plane)} = \frac{\text{Circulation}}{\text{Area}}$$

$$\text{Vorticity}_{xy} = 2\omega_z$$

or vorticity vector

$$\text{Vorticity vector} = 2 [\omega_x \hat{i} + \omega_y \hat{j} + \omega_z \hat{k}]$$

Q3)  $(1, 2) = (3)$

a)  $x - 2y = 0$   
 c)  $x + 2y = 0$

b)  $y - 2x = 0$   
 d)  $y + 2x = 0$

$\tan \theta = \frac{dy}{dx} = \frac{3}{4}$

$\vec{v} = \frac{ax}{r}\vec{i} + \frac{ay}{r}\vec{j}$

$\frac{dy}{dx} = \frac{ay}{ax}$

$q = ax$   
 $v = ay$

$x dy = dx y$

$\int \frac{dy}{y} = \int \frac{dx}{x}$

$\ln y = \ln x + \ln c$

$y = xc$  as  $(1, 2)$  passing

$2 = 1(c) \Rightarrow c = 2$

$y = 2x \Rightarrow y - 2x = 0$

For 2-D of  $x \times y$  given then

$\tan \theta = \frac{dy}{dx} \rightarrow \frac{dx}{4} = \frac{dy}{3} = \frac{dr}{5}$  put in that form  
 $= \frac{3}{4}$  pu

GATE-01) fluid is incompressible & irrotational

Q4)

P)  $u = 2x, v = 3y$

Q)  $u = 2xy, v = 0$

$$\omega_z = \frac{1}{2} \left[ \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right]$$

$$\Gamma_{(xy)} = 2\omega_z (\text{Area}) = 2 \left( -\frac{3}{2} \right) (\pi(2)^2)$$

$$= -12\pi \text{ units}$$

GATE 01)

For a flow through nozzle, incompressible flow the flow velocity along the nozzle axis:

$$V = u_0 \left[ 1 + \frac{3x}{L} \right] \hat{i}$$

where  $L$  = length of the nozzle &  $x$  is distance from its inlet end and find the time  $t$  for a fluid particle on the nozzle axis to travel from its inlet plane to exit plane.

$$V = u_0 \left[ 1 + \frac{3x}{L} \right] \hat{i}$$

$$u = u_0 \left[ 1 + \frac{3x}{L} \right]$$

$$\text{time} = \frac{\text{dist}}{\text{velocity}}$$

For travel dist  $dx$  time  $dt$  & integrate to find where  $dt$

$$t = \int dt = \int_0^L \frac{dx}{u_0 \left[ 1 + \frac{3x}{L} \right]} = \frac{1}{u_0} \left\{ \ln \left[ 1 + \frac{3x}{L} \right] \right\}_0^L$$

$$= \frac{1}{3u_0} \left[ \ln \left[ 1 + \frac{3L}{L} \right] - \ln \left[ 1 + 0 \right] \right]$$

$$t = \frac{L}{3u_0} \ln 4$$

Here  $x$  is vary inversely with  $v$  so,  $V \propto 1/x$  nozzle is converging

Second method

$$v = u_1 = u_0 \left( 1 + \frac{3x}{L} \right) t$$

$$u = u_0 \left( 1 + \frac{3x}{L} \right) = \frac{dx}{dt}$$

$$t = dt = \int_0^L \frac{dx}{u} = \int_0^L \frac{dx}{u_0 \left( 1 + \frac{3x}{L} \right)}$$

→ Potential function  $\phi$  ( $\phi$ -function)

- It is function of space & time defined such that negative derivative w.r.t any direction will give the component of velocity in that direction

$$\phi = \phi(\text{space, time})$$

$$-\left[ \frac{\partial \phi}{\partial x} \right] = u$$

$$-\left[ \frac{\partial \phi}{\partial y} \right] = v$$

$$-\left[ \frac{\partial \phi}{\partial z} \right] = \omega$$

$\phi$ -function is not 3-D

- A line which  $\phi = \text{const}$  then it is equipotential line

**NOTE:** Negative sign indicates flow will always in direction of decreasing potential.

$$\text{so, } \frac{\partial \phi}{\partial x} = \frac{\phi_2 - \phi_1}{x_2 - x_1} = \frac{-ve}{L}$$

**NOTE:** If  $\phi$  function is continuous then it must be irrotational

$$\text{IR} = \omega_z = 0$$

$$\Rightarrow \frac{1}{2} \left[ \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right] = 0$$

$$\Rightarrow \frac{1}{2} \left[ \frac{\partial}{\partial x} \left[ -\frac{\partial \phi}{\partial y} \right] - \frac{\partial}{\partial y} \left[ -\frac{\partial \phi}{\partial x} \right] \right] = 0$$

$$\Rightarrow -\frac{\partial^2 \phi}{\partial x \partial y} + \frac{\partial^2 \phi}{\partial y \partial x} = 0$$

$$\frac{\partial^2 \phi}{\partial x \partial y} = \frac{\partial^2 \phi}{\partial y \partial x} \Rightarrow \text{Continuous function}$$

→ If  $\phi$  function existing then it will be irrotational

→ ψ - function (Stream function)  
 If  $\psi$  function of space & time define such that the derivative w.r.t. to any direction will give the component of velocity at right angle in clockwise direction

$$\frac{\partial \psi}{\partial x} = v$$

$$V = \sqrt{v^2 + u^2}$$

$$\frac{\partial \psi}{\partial y} = -u$$

-  $\psi$  - function is valid for 2-D function

1/2 case 2

$$\frac{\partial \psi}{\partial x} = -v$$

$$\frac{\partial \psi}{\partial y} = u$$

NOTE - If  $\psi$  is 3<sup>rd</sup> order Laplace equation it may be irrotational.

→  $\omega_z = 0$  (for irrotational)

$$\frac{1}{2} \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) = 0 \quad \text{put } v = \frac{\partial \psi}{\partial x} \text{ \& } u = \frac{\partial \psi}{\partial y}$$

$$\frac{1}{2} \left( \frac{\partial}{\partial x} \left( \frac{\partial \psi}{\partial x} \right) - \frac{\partial}{\partial y} \left( \frac{\partial \psi}{\partial y} \right) \right) = 0$$

$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} = 0$$

so  $\nabla^2 \psi = 0$

→ Cavity - Remain's Eq<sup>n</sup> → (CR Eq<sup>n</sup>)

$$u = -\frac{\partial \phi}{\partial y} = -\frac{\partial \psi}{\partial x}$$

$$\Rightarrow \frac{\partial \phi}{\partial x} = \frac{\partial \psi}{\partial y}$$

$$v = \frac{\partial \phi}{\partial x} = \frac{\partial \psi}{\partial y}$$

$$\frac{\partial \phi}{\partial y} = -\frac{\partial \psi}{\partial x}$$

PCIEET CHHENDIPADA

GATE 2003

$$v = \frac{\partial \psi}{\partial x} = \frac{\partial (5xy)}{\partial x} = 5y$$

$$w = -\frac{\partial \psi}{\partial y} = -\frac{\partial (5xy)}{\partial y} = -5x$$

$$V = \sqrt{v^2 + w^2} = \sqrt{(5y)^2 + (-5x)^2}$$

$$= \sqrt{25(9) + 25(1)} = \sqrt{17}$$

$$= 10.8 \text{ m/s}$$

GATE 2003

$$\phi = \log_e [x^2 + y^2] \text{ then } \psi = ?$$

ES

$z = h_1 - h_2$

A siphon draws a water from a 10 reservoir & release into atmosphere as shown. find velocity at point 2

- Ideal gas
- $P_1 = P_2$  and given eq form of Bernoulli eq

- at open surface atmospheric  $P_1$
- of large reservoir we consider area 2nd area large

at siphon  $E_1 = E_2$

$$\left[ z_1 + \frac{P_1}{\rho g} + \frac{V_1^2}{2g} \right]_1 = \left[ z_2 + \frac{P_2}{\rho g} + \frac{V_2^2}{2g} \right]_2$$

$$(h_1 - h_2) + \frac{P_{atm}}{\rho g} + 0 = 0 + \frac{P_{atm}}{\rho g} + \frac{V^2}{2g}$$

$$V = \sqrt{2g(h_1 - h_2)}$$

NOTE :

$V_{approach} = 0$

Area is large at same velocity

100 200  $A \uparrow, V \downarrow$  so  $V = 0$

$A_1 V_1 = A_2 V_2$

so,  $z_1 + \frac{P_1}{\rho g} + \frac{V_1^2}{2g} = 100$   
 $\frac{100}{\rho g} + 0 = 100 + 0 = 100$

NOTE :

When H is given reservoir is not too large

$$V = \sqrt{2gH}$$

NOTE :

$$V = \sqrt{2gH}$$

→ Application :

(1) Venturimeter + to measure flow rate / discharge

principle - By varying area of flow pressure difference is created & that is measured applying Bernoulli equation - flow rate can be estimated

NOTE 1 - pressure flow in throat is minimum

$$Q = A_1 v_1$$

$$z_1 + \frac{P_1}{\rho g} + \frac{v_1^2}{2g} = \text{const}$$

(for Venturimeter) → coefficient discharge  $C_d = 0.98$

$$C_d = \frac{Q_{act}}{Q_{th}}$$

(for orificemeter) → coefficient discharge  $C_d = 0.63$

- convergent angle =  $40^\circ \pm 2^\circ$  ✓
- divergent angle =  $5^\circ$  to  $7^\circ$  ✓
- Length of div > Length of conv.
- dia of throat  $d = \frac{D}{2}$  to  $\frac{D}{3}$

NOTE (1) pressure at throat is minimum. (less than atmospheric) & it should fall below vapour pressure to avoid cavitation

(2) The divergent angle is limiting. Def 5 to 7° [to avoid flow separation]

③ The direction of error governed by vapour pressure of flowing fluid.

As  $z$  value increases error decreases

→ Application of Bernoulli's eq<sup>n</sup>

→ Apply Bernoulli's eq<sup>n</sup> ① & ②

$$z_1 + \frac{P_1}{\rho g} + \frac{V_1^2}{2g} = z_2 + \frac{P_2}{\rho g} + \frac{V_2^2}{2g}$$

$$\left[ z + \frac{P}{\rho g} \right]_1 - \left[ z + \frac{P}{\rho g} \right]_2 = \frac{V_2^2}{2g} - \frac{V_1^2}{2g} = \frac{V_2^2 - V_1^2}{2g}$$

Venturi Head 'H'

$$\rho = \rho A V$$

$$A_1 V_1 = A_2 V_2 = Q \Rightarrow \left( \frac{Q}{A_2} \right)^2 - \left( \frac{Q}{A_1} \right)^2 = 2gH$$

$$Q^2 \left[ \frac{1}{A_2^2} - \frac{1}{A_1^2} \right] = 2gH$$

$$Q_{th} = \frac{A_1 A_2 \sqrt{2gH}}{\sqrt{A_1^2 - A_2^2}}$$

but  $C_d = \frac{Q_{act}}{Q_{th}} \Rightarrow Q_{act} = C_d Q_{th}$

$$Q_{act} = \frac{C_d A_1 A_2 \sqrt{2gH}}{\sqrt{A_1^2 - A_2^2}}$$

→ Venturi Head

$$H = \left[ z + \frac{P}{\rho g} \right]_1 - \left[ z + \frac{P}{\rho g} \right]_2$$

$$H = y \left[ \frac{s_m - 1}{s_o} \right] \text{ m of flowing fluid}$$

for  $[s_m > s_o]$

$$\text{if } s_m < s_o \Rightarrow H = y \left[ 1 - \frac{s_m}{s_o} \right]$$

$$Q_{act} = \frac{C_d A_1 A_2 \sqrt{2gH}}{\sqrt{A_1^2 - A_2^2}}$$

$$Q_{act} = C_d K \sqrt{H}$$

where:  $K = \text{venturi const}$

$$= \frac{A_1 A_2 \sqrt{2g}}{\sqrt{A_1^2 - A_2^2}} \quad \left( \text{unit} \rightarrow \frac{m}{\text{sec}} \right)$$

if  $C_d$  is not given &

using  $Q_{act} \Rightarrow C_d = \frac{Q_{act}}{K \sqrt{H}}$

$$P_1 - P_2 = \rho_w y (s_m - s_o) \text{ N/m}^2 \quad (x)$$

$$= y (s_m - s_o) \text{ m of water } (x)$$

$$= y \left[ \frac{s_m - 1}{s_o} \right] \text{ m of flowing fluid } (y)$$

NOTE: ① If there is an  $x\%$  error in the velocity measg measurement; the corresponding error in measurement of flow rate  $\frac{x}{2}\%$ .

$2\%$  error  $\rightarrow$  Head measurement  
 $\frac{1}{2}\%$  error  $\rightarrow \frac{x}{2}\%$   $\rightarrow \left[\frac{dQ}{Q}\right]$

$\rightarrow Q \propto \sqrt{H} \Rightarrow Q = C\sqrt{H}$  — (1)  
 $dQ = C \cdot \frac{1}{2\sqrt{H}} \cdot dH$  — (2)  
 $\frac{dQ}{Q} = \frac{C \cdot \frac{1}{2\sqrt{H}} \cdot dH}{C\sqrt{H}} = \frac{1}{2} \left(\frac{dH}{H}\right)$   
 $\left[\frac{dQ}{Q} = \frac{1}{2} \left(\frac{dH}{H}\right)\right]$

Application:

• Orificemeter: To measure the flow rate / discharge.

- To measure the flow rate / discharge.
- Approximate value of  $C_d = 0.63$  to  $0.67$
- Large dia. pipe

Where:  $A_1 = A_{\text{dia}}$  of main pipe  
 $A_0 = A_{\text{dia}}$  of orificemeter  
 $A_2 =$  The min. area at vena contracta

coefficient of contraction ' $C_c$ '

$$C_c = \frac{A_2}{A_0} \Rightarrow A_2 = A_0 \times C_c$$

$$Q_{\text{act}} = \frac{C_d A_1 A_2 \sqrt{2gH}}{\sqrt{A_1^2 - A_2^2}}$$

$$\text{but } \rightarrow K = \frac{1.49}{\sqrt{a_1^2 - a_2^2}} \quad \frac{\text{m}^{-1}}{\text{sec.}} \quad (\text{unit})$$

$$Q = C_d K \sqrt{H}$$

$$\& H = y \left[ \frac{z_1}{y_1} - 1 \right] \quad (\text{Pressure Head difference})$$

const

**Ex** Flow of circular pipe of 30 cm diameter connected inclined at 30° with venturimeter of 50 cm dia using mercury has manometric fluid with deflection of 10 cm estimate the approximate flow rate by considering the loss across venturimeter 10% of K.E at enter

$\rightarrow Q_e = 0.0706$

$Q_1 = 0.1962$

$Q_{\text{app}} = Q$

$y = 10 \text{ cm} = 0.1 \text{ m} \rightarrow H = y \left[ \frac{30}{50} - 1 \right]$

$= 1.26 \text{ m of } \frac{\Delta \rho}{\rho}$

Gate

1st case

$C_d = \frac{H - h_{\text{loss}}}{H} = \frac{1.26 - (0.2) \frac{V^2}{2g}}{1.26}$  (we can't find  $V$  or  $Q$  given)  
so take  $C_d = 0.96$  (ass)

$h_{\text{loss}} = 20\% \text{ of } K.E$   
 $= 0.2 \left( \frac{V^2}{2g} \right) \rightarrow \text{neg}^{\text{ve}} \text{ value}$

$Q_{\text{app}} = \frac{(0.96)(0.1962)(0.0706)}{\sqrt{0.96^2 - 0.0706^2}}$

$Q_{\text{app}} = 0.3665 \text{ m}^3/\text{s}$

2nd case : (our solution)

$E_1 = E_2 + h_{\text{loss}}$

$\left[ Z + \frac{P}{\rho g} + \frac{V^2}{2g} \right]_1 = \left[ Z + \frac{P}{\rho g} + \frac{V^2}{2g} \right]_2 + 0.2 \frac{V^2}{2g}$

$\left[ Z + \frac{P}{\rho g} \right]_1 - \left[ Z + \frac{P}{\rho g} \right]_2 = \frac{V_1^2}{2g} + 0.2 \frac{V_1^2}{2g} - \frac{V_2^2}{2g} = \frac{V_1^2 - 0.4V_1^2}{2g}$

$$\left[ z + \frac{v^2}{2g} \right]_1 - \left[ z + \frac{v^2}{2g} \right]_2 = H = y \left[ \frac{v_0^2}{2g} - 1 \right] = \frac{v_0^2 - 0.8v_0^2}{2g}$$

$$\therefore \frac{v_0^2 - 0.8v_0^2}{2g} = y \left[ \frac{v_0^2}{2g} - 1 \right]$$

$$\therefore \left( \frac{Q}{A_2} \right)^2 - 0.8 \left( \frac{Q}{A_1} \right)^2 = 2gy \left[ \frac{v_0^2}{2g} - 1 \right]$$

$$Q^2 = \frac{2gy \left[ \frac{v_0^2}{2g} - 1 \right]}{\frac{1}{A_2^2} - \frac{0.8}{A_1^2}}$$

$$Q = \sqrt{\frac{2 \times 9.81 \times 1.26}{\left( \frac{1}{0.0706} \right)^2 - \left( \frac{0.8}{0.1063} \right)^2}}$$

$$Q_{or} \approx 0.376 \text{ m}^3/\text{s} \quad \text{by considering Cd totally.}$$

**GATE-18**  
**AIS** For a measurement of flow of water through a circular pipe using venturimeter with  $C_d = 0.98$  was replaced by orificemeter of  $C_d = 0.63$  for the same flow. Parameter the ratio of pressure drop across the two venturi to orificemeter.

$$\rightarrow Q_v = Q_o \quad \boxed{H = \text{Pressure Head difference} = \Delta P}$$

$$C_d v \sqrt{2H} = C_o K \sqrt{H_o}$$

$$\frac{H_v}{H_o} = \frac{0.63^2}{0.98^2}$$

$$\frac{\Delta P_{venturi}}{\Delta P_{orifice}} = \frac{0.63^2}{0.98^2}$$

- If  $y$  in venturimeter is 10 cm then;  $y$  in orificemeter = ?

$$y = H \left[ \frac{v_0^2}{2g} - 1 \right] \rightarrow y \propto H$$

$$\frac{y_{venturi}}{y_{orifice}} = \frac{H_{venturi}}{H_{orifice}} = \frac{0.63^2}{0.98^2} = \frac{C_d^2}{C_o^2}$$

$$\rightarrow y_{orifice} = 24.1 \text{ cm}$$

**NOTE**

$$\boxed{y \propto \frac{1}{C_d^2} \propto H \propto P}$$

$$Q = C_d K \sqrt{y \left[ \frac{v_0^2}{2g} - 1 \right]} = C_d K \sqrt{H}$$

$$Q \propto \frac{1}{\sqrt{y}} \propto \sqrt{y} \propto \frac{1}{C_d} \propto \sqrt{H}$$

① Pitot tube  
→ To measure velocity

It is point where particle is at rest (stagnation pt) i.e. velocity zero  
 so the energy is not destroyed so it converted into pressure head.  $[z + \frac{p}{\rho g}]$  at pt

$$\left[ z + \frac{p}{\rho g} \right] + \frac{V^2}{2g} = 100$$

⑥  $60 + 40 = 100$

$h_{static}$

⑦ But at Stagnation  $V = 0$  convert const

$100 + 0 = 100$

$h_{stg}$

⑧ But convert energy in to K.E →  $h_{dyn}$

$60 + 40 = 100$

$h_{dyn}$

$$h_{tot} = h_{static} + h_{dynamic}$$

- ① velocity
- ② static pressure head
- ③ Dynamic pressure head
- ④ Stagnation pressure head

→ Pitot tube measure stagnation pressure  
 → at velocity  $V = \sqrt{2g h_{dynamic}}$  is  $h_{dynamic}$  head

$$V = \sqrt{2g h_{dynamic}}$$

Apply Bernoulli's eqn ① & ②

$$\left[ z + \frac{p}{\rho g} + \frac{V^2}{2g} \right]_1 = \left[ z + \frac{p}{\rho g} + \frac{V^2}{2g} \right]_2$$

$$\underbrace{\left[ z + \frac{p}{\rho g} \right]_1}_{h_{tot}} + \frac{V^2}{2g} = \underbrace{\left[ z + \frac{p}{\rho g} \right]_2}_{h_{stg}} + \frac{V^2}{2g}$$

$$\frac{V^2}{2g} = h_{tot} - h_{stg} = h_{dynamic}$$

$$V_{th} = \sqrt{2g h_{dynamic}}$$

but  $C_v = \frac{V_{act}}{V_{th}} \Rightarrow$

$$V_{act} = C_v \sqrt{2g h_{dynamic}}$$

$$C_d = C_c \times C_v$$

⇒ Measurement of flow velocity by Pitot-static probe

- above method more not possible because not fluid having density low than air; Air has low  $\rho$ ; against gravity not possible.
- Gas is incompressible fluid  $\Rightarrow (M < 0.4)$
- If Gas velocity measure by Pitot-static tube

$$\underbrace{\left[ z + \frac{P}{\rho_0 g} \right]}_{\text{h}_{\text{stg}}} - \underbrace{\left[ z + \frac{P}{\rho_0 g} \right]}_{\text{h}_{\text{dyn}}} = h_{\text{dyn}}$$

$$= y \left[ \frac{\rho_m}{\rho_0} - 1 \right]$$

$$V = C_v \sqrt{2g y \left[ \frac{\rho_m}{\rho_0} - 1 \right]}$$

$$V = C_v \sqrt{2g y \left[ \frac{\rho_m}{\rho_0} - 1 \right]}$$

S of ~~static~~ flowing fluid (main pipe) ;  $S = \frac{\rho_m g y}{\rho_0 g}$   
 $= \frac{\rho_m y}{\rho_0}$

- pitot tube measure  $V_{\text{mean}}$  (mean velocity)

Ex. for measurement of velocity of water through a pipe use pitot-static tube with coefficient of 0.98; the stagnation pressure head was estimated of 3 m or static pressure head 0.5 m the approximate flow of velocity will be

$$\rightarrow h_{\text{dynamic}} = h_{\text{stg}} - h_{\text{stg}}$$

$$= 3 - 0.5$$

$$h_{\text{dyn}} = 2.5$$

$$V = C_v \sqrt{2g h_{\text{dyn}}} = 0.98 \sqrt{2 \times 9.81 \times 2.5}$$

$$V = 6.8 \text{ m/s}$$

Ex.

$\rho_{\text{air}} = 1.2 \text{ kg/m}^3$ ;  $V_{\text{gas}} = 0$ ;  $\rho_0 = 1.2 \text{ kg/m}^3$   
 $\rho_m = 1000 \text{ kg/m}^3$   
 (water)

$$V = C_v \sqrt{2g y \left[ \frac{\rho_m}{\rho_0} - 1 \right]}$$

$$= C_v \sqrt{2g y \left[ \frac{\rho_m}{\rho_0} - 1 \right]}$$

S of air (flowing in main pipe)

$$= 0.98 \sqrt{2 \times 9.81 \times 0.01 \left[ \frac{1000}{1.2} - 1 \right]}$$

$$V = 12.77 \text{ m/s}$$

Ex For measurement of air velocity by Pitot-static probe  
 flow air  $\rho_{air} = 1.2 \text{ kg/m}^3$  ( $\rho_0$ ) with manometric fluid  
 of density  $800 \text{ kg/m}^3$  the diff<sup>n</sup> in stagnation & static  
 pressure is estimated as  $350 \text{ Pa}$   $V_{flow}(\text{air}) = 10$

$$\rightarrow P_{stg} - P_{static} = 350 \text{ N/m}^2$$

$$z + \frac{P}{\rho g} + \frac{V^2}{2g} = z_0 + \frac{P_0}{\rho g} + \frac{V_0^2}{2g}$$

$$P_{dynamic} = \frac{\rho V^2}{2} = P_{stg} - P_{stg} = 350 \text{ N/m}^2$$

$$h_{dynamic} = 350 \times \frac{1}{800 \times 9.81}$$

$$P_{dynamic} = 350 \text{ N/m}^2$$

$$h_{dynamic} = \frac{P_{dynamic}}{\rho g} = \frac{P_{dynamic}}{\rho_0 g} = \frac{350}{1.2 \times 9.81}$$

where:  $\rho$  is flowing fluid (air)

$$V = C_d \sqrt{2g h_{dyn}} = 1.0 \sqrt{2 \times 9.81 \times \frac{350}{1.2 \times 9.81}}$$

$$V = 25.5 \text{ m/s}$$

- $\sqrt{2g(h_1 + h_2 + h_3)}$
- $\sqrt{2g \left[ \frac{\rho_1 h_1 + \rho_2 h_2 + \rho_3 h_3}{\rho_1 + \rho_2 + \rho_3} \right]}$
- $\sqrt{2g h_3 \left[ 1 + \frac{\rho_1 h_1}{\rho_3 h_3} + \frac{\rho_2 h_2}{\rho_3 h_3} \right]}$
- x

Apply Bernoulli eq<sup>n</sup> @ 1 & 2

$$\left[ z + \frac{P}{\rho g} + \frac{V^2}{2g} \right]_1 = \left[ z + \frac{P}{\rho g} + \frac{V^2}{2g} \right]_2$$

$$\text{Flowing fluid} \quad \rho_3 g \left[ \frac{\rho_1 h_1 + \rho_2 h_2 + \rho_3 h_3}{\rho_3} \right] + 0 = 0 + \frac{\rho_3 V^2}{2g}$$

$$V^2 = \frac{2g [\rho_1 h_1 + \rho_2 h_2 + \rho_3 h_3]}{\rho_3} = \frac{h_3}{h_3}$$

$$V = \sqrt{2g h_3 \left[ 1 + \frac{\rho_1 h_1}{\rho_3 h_3} + \frac{\rho_2 h_2}{\rho_3 h_3} \right]}$$

Here it is change  
 Reference A  $\uparrow$   $V_A = 0$   
 so  $V = 0$   
 $V = 0$  (at Approach)

where diameter reduced from 20 cm to 10 cm in horizontal pipe line. The pressure in 20 cm pipe just upstream of reducer is 150 kPa & the vapour pressure is 10 kPa, &  $\gamma = 5 \text{ kN/m}^3$ ; estimate the max possible flow rate that can pass through reducer without causing cavitation.

$$a_1 = \pi r_1^2 = \pi (0.1)^2 = 0.0314 \text{ m}^2 \quad \gamma = 5 \text{ kN/m}^3$$

$$a_2 = \pi r_2^2 = \pi (0.05)^2 = 0.00785$$

$$P_1 = 150 \text{ kPa} = 150 \times 10^3 \text{ N/m}^2$$

$$A_1 \left[ \frac{P}{\rho g} + \frac{V^2}{2g} \right] = A_2 \left[ \frac{P}{\rho g} + \frac{V^2}{2g} \right]$$

$P_{\min} \rightarrow$  at least cross section

so, with cavitation  $P_{\min} = P_{\text{vapour}}$

$$\text{so, } P_2 = P_{\min} = 50 \times 10^3 \text{ N/m}^2 \geq P_v$$

$$\frac{150 \times 10^3}{5 \times 10^3} + \frac{V_1^2}{2g} = \frac{50 \times 10^3}{5 \times 10^3} + \frac{V_2^2}{2g}$$

$$\frac{V_2^2 - V_1^2}{2g} = 100 = 20$$

$$V_2^2 - V_1^2 = 20 \times 2 \times 9.81$$

$$\text{but } Q = A_1 V_1 = A_2 V_2 \Rightarrow 0.0314 V_1 = 0.00785 V_2$$

$$V_2 = 4 V_1$$

$$(4V_1)^2 - V_1^2 = 2 \times 20 \times 9.81$$

$$V_1 = \sqrt{\frac{2 \times 20 \times 9.81}{15}}$$

$$V_1 = 5.11 \text{ m/s}$$

$$\rightarrow Q_1 = A_1 V_1 \Rightarrow Q = 0.16 \text{ m}^3/\text{s}$$

$\Rightarrow$  convert problem in venturimeter

$$Q_{th} = \frac{a_1 a_2}{\sqrt{a_1^2 - a_2^2}} \sqrt{2gH}$$

$$\text{but } H = \left[ \frac{P_1}{\rho g} + \frac{P}{\rho g} \right] - \left[ \frac{P_2}{\rho g} + \frac{P}{\rho g} \right]$$

$$= \frac{150}{5} - \frac{50}{5} = 20$$

$$Q_{th} = 0.16 \text{ m}^3/\text{s}$$

17

$$(KE)_{mean} = \frac{1}{A} \int V^2 dA$$

Ex: For a fluid flowing through a pipeline, the velocity profile may be approximated as zero over  $\frac{1}{3}$ rd of area & that remain constant over the rest of area. Then (K.E) correction factor,  $\alpha$

zero  $\rightarrow$   $\frac{1}{3}$ rd  $\rightarrow$  C  
 Const  $\rightarrow$   $\frac{2}{3}$ rd  $\rightarrow$  V

$$\alpha = \frac{(KE)_{act}}{(KE)_{mean}} = \frac{\int V_{act}^2 dA}{V_{mean}^2 A} = \frac{\int V^2 dA}{V_{mean}^2 A}$$

$$\int V^2 dA = V_{max}^2 \int_{\frac{1}{3}A}^A dA + \int_0^{\frac{1}{3}A} 0^2 dA = V^2 [A - \frac{1}{3}A]$$

$$\int V^2 dA = \frac{2AV^2}{3}$$

$$V_{mean} = \frac{Q}{A} = \frac{\int V dA}{A}$$

$$\int V dA = \int_0^{\frac{1}{3}A} 0 dA + \int_{\frac{1}{3}A}^A V dA = V [A - \frac{1}{3}A] = \frac{2AV}{3}$$

$$V_{mean} = \frac{2AV}{3A} = \frac{2V}{3}$$

$$\text{SO: } \alpha = \frac{\frac{2AV^2}{3}}{A \left(\frac{2V}{3}\right)^2} = \frac{\frac{2}{3} \left(\frac{3}{2}\right)^3}{\left(\frac{3}{2}\right)^2} = \frac{9}{8}$$

$$Re = \frac{F_i}{F_v} = \frac{\rho v \text{ char. length}}{\mu} = \frac{\rho v L}{\mu}$$

If handling mention  
Case: diameter pipe

	Circular pipe	Between parallel plates	Plate open channel	Over a split from col/le
Laminar	$Re < 2000$ <i>Re critical</i>	$Re < 1000$	$Re < 600$	$Re < 1$
Transition	$2000 < Re < 4000$	$1000 < Re < 2000$	$700 < Re < 1000$	$1 < Re < 2$
Turbulent	$Re > 4000$	$Re > 2000$	$Re > 1000$	$Re > 2$

Minor loss:

①  $h_L$  due to sudden contraction

$$h_L = \left[ \frac{1 - C_c}{C_c} \right] \frac{V_2^2}{2g}$$

velocity at contraction

Where:  $C_c$  = coefficient of contraction

If  $C_c$  is not given:

$$h_L = 0.5 \frac{V_2^2}{2g}$$

②  $h_L$  due to sudden expansion

$$h_L = \frac{V_1^2 - V_2^2}{2g}$$

③  $h_L$  at entries

$$h_L = 0.5 \frac{V^2}{2g}$$

velocity at entry

SCHEMENDIPADA

velocity at exit

$$h_L = \frac{V^2}{2g}$$

Where; K = loss coefficient

Frictional loss:

Darcy withbacks Equation

$$h = \frac{4fLV^2}{2gd}$$

Where, V = V<sub>mean</sub>

f = frictional coefficient

= 0.008 to 0.01

4f = F

= frictional factor

= 0.02 to 0.04

modified Darcy eq<sup>n</sup>:

$$h = \frac{FLV^2}{2gd}$$

By seeing <sup>of</sup> ~~eq<sup>n</sup>~~, decide to take 'f' or 'F'

Re < 2000 → F =  $\frac{64}{Re}$  → Laminar

Re > 2000 → F =  $\frac{0.316}{(Re)^{1/4}}$  → Turbulent

For flow: Q = AV → V =  $\frac{Q}{\pi/4 d^2}$

$$h = \frac{FLV^2}{2gd} = \frac{FL}{2gd} \left( \frac{Q}{\pi/4 d^2} \right)^2$$

$$h = \frac{FLQ^2}{12.1 d^5}$$

- Friction factor also consider come from Moody chart

spec case (i)

Where  $F = F$   
 $L = dx$   
 $Q = q$   
 $d = d_3$

so:  $h_f = \int dh_f$   
 $= \int \frac{FLQ^2}{12.1 d^5}$   
 $= \int \frac{F(dx) Q^2}{12.1 d_3^5}$

but  $d_3 = d_1 + \left(\frac{d_2 - d_1}{L}\right)x$

so:  $h_f = \frac{F Q^2}{12.1} \int_0^L \frac{dx}{\left[d_1 + \left(\frac{d_2 - d_1}{L}\right)x\right]^5}$   
 $= \frac{F Q^2}{12.1} \int_0^L \frac{dx}{[A + Bx]^5}$   
 $= \frac{F Q^2}{12.1} \left[ \frac{[A + Bx]^{-4}}{-4} \right]_0^L = \frac{-F Q^2}{(12.1)(4)} \left[ \left[d_1 + \left(\frac{d_2 - d_1}{L}\right)L\right]^{-4} - [d_1 + 0]^{-4} \right]$   
 $h_f = \frac{F Q^2}{48.4} \left[ \frac{1}{d_1^4} - \frac{1}{d_2^4} \right] \left[ \frac{L}{d_2 - d_1} \right]$

spec case (ii)

$h_f = \frac{1}{3} \left( \frac{FLQ^2}{12.1 d^5} \right)$   
 $Q = q \cdot L$

- Here discharge is varying because of too many pipes  
 so, 10, 10, 10, 10

- Here length is varying across flow enough etc so take element of uniform length

so:  $h_f = \int dh_f = \int \frac{F(dx) Q^2}{12.1 d^5}$   
 $Q = q - qx = q[L - x]$

$h_f = \frac{1}{3} \left( \frac{FLQ^2}{12.1 d^5} \right)$

$$V = C \sqrt{m i} = C \sqrt{R S}$$

where  $V = V_{\text{mean}}$

$C = \text{Chezy's constant}$

$i, s = \text{Hydraulic slope / gradient} = \left[ \frac{h_f}{L} \right]$

$$C = \sqrt{\frac{8g}{F}}$$

$m \text{ (or) } R = \text{mean Hydraulic mean depth}$   
radius

$$= \frac{\text{Area of flow}}{\text{wetted perimeter}} = \frac{A}{P}$$

→ for circular pipe, running full

$$m = \frac{A}{P} = \frac{\frac{\pi d^2}{4}}{\pi d} = \frac{d}{4}$$

$$m = d/4$$

→ for circular pipe, running half full

$$m = \frac{A}{P} = \frac{(\frac{\pi}{4} d^2) \frac{1}{2}}{\pi d \frac{1}{2}} = \frac{d}{4}$$

→

$$V = C \sqrt{m i}$$

$$V^2 = C^2 m i$$

$$= \frac{8g}{F} \frac{d}{4} \cdot \frac{h_f}{L}$$

$$= \frac{8g}{F} C^2$$

$$C = \sqrt{\frac{8g}{F}}$$

→ Power Transmission :-

Hydraulic Power / Water Power  
{Net Available}

$$H.P. = \gamma Q [H - h_f]$$

Loss of power  
 additional power } =  $\gamma Q h_f$   
 pumping power

where:  $h_f = \frac{f L Q^2}{12.1 d^5}$

$$\eta = \frac{\gamma Q (H - h_f)}{\gamma Q H} \Rightarrow \eta = \frac{H - h_f}{H}$$

PSU

condition for  $P_{max}$ :  $h_f = H/3$

$$\eta_{max} = 66.67\%$$

condition for maximum power

$$P = \gamma Q (H - h_f) = \gamma Q \left[ H - \frac{f L Q^2}{12.1 d^5} \right]$$

$$\rightarrow \frac{dP}{dQ} = 0$$

★ Impact of Jet

→ linear momentum equation  
based on Newton's second law

① Impact of Jet on flat, smooth, vertical fixed

① fixed plate: plate / blade / vane / bucket

$$F = ma = \frac{F(\Delta v)}{\text{time}}$$

$$= \frac{m}{\text{time}} (\Delta v)$$

$$= \dot{m} (\Delta v)_n$$

$$F_n = \dot{m} (\Delta v)$$

$$F_n = \rho SQ [v_1 - v_2]_n$$

$$P = F_n \times (\text{velocity})_{\text{blade}}$$

$$P = F_n \times v_{\text{blade}}$$

$$m = \rho A L (V - 0)$$

$$= \rho A V [V - 0]$$

for deflection  $B = 1.33$

$$F_n = \rho A V^2$$

$$P = F_n \times \eta$$

$$P = 0$$

② Inclined plate

$$Q_1 = \frac{Q}{2} [1 + \cos \theta]$$

$$Q_2 = \frac{Q}{2} [1 - \cos \theta]$$

$$F = m (\Delta v_{el})_n = \rho A V [V \sin \theta - 0]$$

$$F_n = \rho A V^2 \sin \theta$$

$$P = F_n \times \eta$$

$$P = 0$$

③ Curved (symmetric)

$180 - \theta \rightarrow$  Angle of deflection

$$F_n = m (\Delta v_{el})_n$$

$$= \rho A V [V - (-V \cos \theta)]$$

$$F_n = \rho A V^2 [1 + \cos \theta]$$

$$P = F_n \times \eta$$

$$P = 0$$

$\theta = 10-20^\circ$  generally  $\rightarrow$  optimum deflection angle =  $160-150$

④ Moving blade

$[V > u]$  assumption is

$$F_n = m (\Delta v_{el})_n$$

$$= \rho A (V - u) [V - u]$$

relative velocity

$$F_n = \rho A (V - u)^2$$

$$P = F_n \times \eta$$

$$P = \rho A (V - u)^2 \eta$$

$$F_n = \dot{m} (\Delta v)_{n1}$$

$$= \rho A V (v - u)$$

$$F_n = \rho A V (v - u)$$

$$P = F_n \times u$$

$$P = \rho A V (v - u) u$$

$$\phi \quad u = \frac{2DN}{60}$$

⇒ Efficiency

$$\eta = \frac{\text{output}}{\text{K.E of jet}} = \frac{\text{POWER}}{\text{K.E of jet}}$$

$$= \frac{\rho A V (v - u) u}{\frac{1}{2} \left( \frac{\dot{m}}{\rho} \right) \cdot v^2} \quad \left| \quad \dot{m} = \rho A V \right.$$

$$\boxed{\eta = \frac{2u(v-u)}{v^2}}$$

→ condition for max. efficiency:

$$\frac{d\eta}{du} = \frac{d}{du} \left[ \frac{2u(v-u)}{v^2} \right]$$

$$\Rightarrow \frac{2}{v^2} \frac{d}{du} [v u - u^2] = 0$$

$$v - 2u = 0$$

$$\boxed{u = \frac{v}{2}}$$

$$\downarrow F_n = \rho A V (v - u)$$

$$= \rho A V (v - \frac{v}{2}) \uparrow$$

$$\uparrow F_i = F_n \times u \uparrow$$

⇒ Special condition:

Impact of jet on hinged plate.

$$\sin \theta = \frac{2 \rho A v^2 x}{W L}$$

if impact at middle of plate  
 $x = L/2$

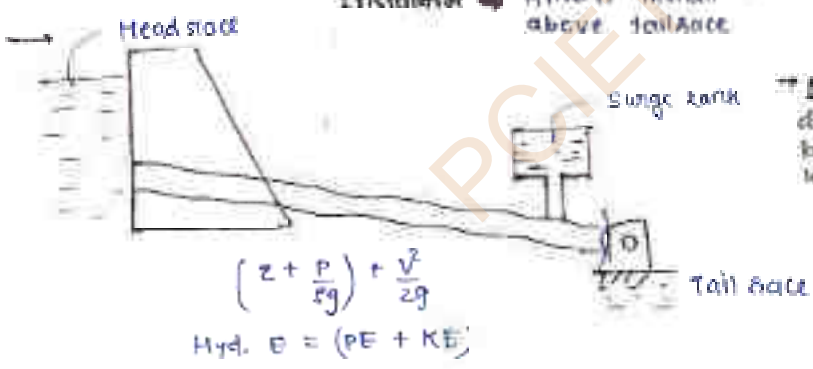

$$\boxed{\sin \theta = \frac{\rho A v^2}{W}}$$

PCIET CHHENDIPADA

→ Boundary layer theory is given by L. Prandtl (in 1904)

$v_0 = v_{max}$   
= free stream velocity

condition for "NO SLIP"

- Whenever real fluid flows over solid boundary because of no slip condition fluid particles will get stuck to the boundary; hence velocity of particles will be equal to velocity of boundary i.e. the object is at rest. Fluid particles directly near the boundary will be zero and at a small distance in normal dir<sup>n</sup> particle velocity keeps on increasing at leading to max. value at a dist<sup>n</sup> of  $\delta$  known as boundary layer thickness. This zone where velocity gradient exists is the boundary layer zone.

⇒ Boundary condition:

- ① external flow:
  - ①  $y=0 \rightarrow$  at boundary  $v=0$
  - ②  $y=\delta \rightarrow v=v_0=v_{max}$
  - ③  $y=0 \rightarrow z=z_0 = z_{max}$  [ $\frac{dz}{dy}$  is max.]
  - ④  $y=\delta \rightarrow z=z_{min}=0$
  - ⑤  $x=0 ; \delta=0$  (leading edge)

→ As distance increases from the feeding edge phase transition rate is increased so the potential difference will also increase & driving potential is max at  $y = \delta$

100°C	}	$\Delta T$	time
			2 sec
90°C	}	$\Delta T$	5 sec
80°C			
40°C	}	$\Delta T$	5 hr
30°C			

However same  $\Delta T$  dist<sup>n</sup> the time req<sup>d</sup> to reach in 90°C to 80°C is more because due to phase transitions time require more

same in welding nearer to surface grain etc is more b/c compare to surface

② Internal flow

→ flow through pipe

$r = 0$ , center :  $V = V_0 = V_{max}$  ;  $\tau = \tau_{max} = 0$   
 $r = R$  : wall ;  $V = 0$  ;  $\tau = \tau_{max} = \tau_c$

$y = R - r \Rightarrow dy = -dr$

$$\tau = \mu \left( -\frac{dv}{dy} \right)$$

### ① Laminar zone (Critical)

- The velocity profile with a laminar zone is parabolic & is given by

$$\frac{v}{V_0} = \left(\frac{y}{\delta}\right)^2 \quad ; \quad \eta = 1 \text{ to } 3 \quad (\text{parabolic})$$

if nothing is mentioned take  $\eta = 1$

$$\frac{v}{V_0} = \left(\frac{y}{\delta}\right) \quad (\text{nothing})$$

### ② Turbulent zone

- velocity profile in the logarithmic zone is given by

$$\frac{v}{V_0} = \left(\frac{y}{\delta}\right)^{1/4} \quad ; \quad \eta = 1/4 \quad (\text{logarithmic})$$

if nothing is mentioned take  $\eta = 1/4$

$$\frac{v}{V_0} = \left(\frac{y}{\delta}\right)^{1/7}$$

- Governed by  $1/4^{\text{th}}$  power law

### ⇒ Laminar sub-layer zone ( $\delta'$ )

\* Within the turbulent zone near the boundary always laminar sub-layer will exist though the actual profile is parabolic it will be treated as linear in practice calculations.

$$\delta' = \frac{11.6\nu}{V_x}$$

where:  $\nu$  = kinematic viscosity

$V_x$  = shear velocity =  $\frac{\tau_0}{\rho}$

$$\delta' \propto \frac{1}{Re}$$

→ Limiting conditions to be in laminar zone

[Length of laminar zone]

will be given by critical condition

$$Re_{local} < Re_{critical}$$

$$Re_{critical} = 5 \times 10^5$$

$$Re_L < 5 \times 10^5$$

(for circular pipe)  
(for flat plate)

$$Re_x < 4000$$

(for circular pipe)

→ Boundary layer thickness ( $\delta$ )

→ It is dist<sup>n</sup> from the boundary to a point in normal dist<sup>n</sup> where velocity reaches 99% its maximum velocity.

$$\frac{\delta}{x} = \frac{c}{\sqrt{Re_x}}$$

(Laminar)

$$\delta \propto \sqrt{x}$$

$$\frac{\delta}{x} = \frac{0.376}{(Re_x)^{1/4}}$$

(Turbulent)

$$\delta \propto (x)^{0.8}$$

**NOTE:**

→ above eq<sup>n</sup> based on Blasius's experimental result which can be used in absence of actual velocity profile

→ when actual velocity profile is known von Karman's momentum integral

$$\frac{z_0}{V_0^2} = \frac{d\theta}{dx}$$

where  $\theta$  = momentum thickness

$$\theta = \int_0^{\delta} \frac{v}{V_0} \left[ 1 - \frac{v}{V_0} \right] dy$$

GATE 2000] The velocity boundary layer over a flat plate at point 'A' is 2 cm, and at point B 1 m downstream of 'A' is 3 cm. the dist<sup>n</sup> of 'A' from leading edge of the plate

$$\delta_A = 2 \text{ cm} \rightarrow x_A = 3 \text{ cm}$$

$$S_B = 100 \text{ cm} \rightarrow v_B = 8)$$

$$\frac{\delta}{\sqrt{x}} = \text{const} \Rightarrow \frac{\delta_A}{\sqrt{x_A}} = \frac{\delta_B}{\sqrt{x_B}}$$

$$x_B = \left(\frac{\delta_B}{\delta_A}\right)^2 x_A = \left(\frac{100}{2}\right)^2 (3) = \frac{10000 \times 3}{4}$$

	A	B
$\delta$	2	3
dist <sup>n</sup>	$x$	$x+1$

$$\frac{\delta_1}{\delta_2} = \sqrt{\frac{x_1}{x_2}} = \sqrt{\frac{x}{x+1}} = \frac{2}{3}$$

$$\frac{x}{x+1} = \frac{4}{9}$$

$$x = 0.8$$

Ex For flow of an oil stream over a flat plate of 1.2 m wide and 2 m long with free stream velocity of 6 m/s  $\rho = 1.2 \text{ kg/m}^3$ ;  $\nu = 1.47 \times 10^{-5} \text{ m}^2/\text{s}$  upto what length over the plate will boundary layer be laminar

$$\rightarrow Re = \frac{\rho U \infty}{\mu} = 5 \times 10^5 = Re_{\text{critical}}$$

$$\frac{\rho \times L}{1.47 \times 10^{-5}} \leq 5 \times 10^5$$

$$L \leq 1.225 \text{ m}$$

$$Re_{\text{local}} < Re_{\text{critical}}$$

Q-12] For a flow over a flat plate; at  $Re = 1000$  (laminar) at an instant the boundary layer thickness 4 mm is the velocity alone is increased by a factor of 4 & at that location in mm

$$\frac{\delta}{x} = \frac{5}{\sqrt{Re_x}}$$

$$\delta_1 \sqrt{Re_1} = \delta_2 \sqrt{Re_2}$$

$$\delta_2 = \frac{4 \times \sqrt{Re}}{2 \sqrt{Re}}$$

$$\delta_2 = 2 \text{ mm}$$

$$Re = \frac{\rho U \infty}{\mu} \rightarrow Re_2 = 4Re$$

over a flat plate is given by  $\frac{v}{V_0} = \frac{3y}{2\delta} - \frac{1}{2}\left(\frac{y}{\delta}\right)^3$

$C_x = \frac{4.795x}{\sqrt{Re_x}}$  for a free stream velocity of 2 m/s

$\rho_{air} = 1.2 \text{ kg/m}^3$ ;  $\mu_{air} = 1.5 \times 10^{-4} \text{ kg/ms}$ ; wall shear stress at a dist<sup>n</sup> of 1 m from upstream end,  $x = 1$

$$\frac{\partial v}{\partial y} = \frac{3}{2} - \frac{3}{2}\left(\frac{y}{\delta}\right)^2$$

$$\left. \frac{\partial v}{\partial y} \right|_{y=0} = \frac{3}{2}$$

$$\tau_0 = \mu \frac{\partial v}{\partial y} = 4 \frac{3}{2} \mu V_0$$

$$\tau_{y=0} \Big|_{x=1} = \mu \left[ \frac{dv}{dy} \right]_{y=0; x=1}$$

$$= \mu \frac{d}{dy} \left[ V_0 \left\{ \frac{3}{2} \frac{y}{\delta} - \frac{1}{2} \left(\frac{y}{\delta}\right)^3 \right\} \right]$$

$$\tau_0 = \frac{3 \mu V_0}{2\delta}$$

$$\begin{aligned} \text{so, } \tau_0 &= \frac{3 \mu V_0}{2 \left( \frac{4.795x}{\sqrt{Re_x}} \right)} \\ &= \frac{3 \times 1.5 \times 10^{-4} \times 2}{2 \times \frac{4.795 \times 1}{\sqrt{\frac{1.2 \times 2 \times 1}{1.5 \times 10^{-4}}}}} \end{aligned}$$

$$\tau_0 = 3.70 \times 10^{-7} \text{ N/m}^2$$

ES]  $\frac{v}{V_0} = C_0 + C_1 \frac{y}{\delta} + C_2 \left(\frac{y}{\delta}\right)^2 + C_3 \left(\frac{y}{\delta}\right)^3$

velocity = (v)  
 $\tau = (\tau)$   
 $\delta = \delta(x, Re)$

i)  $y = 0 \Rightarrow v = 0$

ii)  $y = \delta \Rightarrow \left(\frac{dv}{dy}\right) = 0$

iii)  $y = \delta \Rightarrow v = V_0$

iv)  $\left(\frac{d^2v}{dy^2}\right) = 0 \Rightarrow y = 0$

$\frac{v}{V_0} = \frac{3}{2} \frac{y}{\delta} - \frac{3}{2} \left(\frac{y}{\delta}\right)^3$  ← Cubic

$\tau = \mu \left(\frac{dv}{dy}\right) = \mu V_0 \left[ \frac{3}{2\delta} - \frac{3}{2} \frac{y^2}{\delta^3} \right]$  ← parabolic

$C_x = \frac{2}{\rho V_0^2} \int_0^\delta \tau \, dy$        $\tau_0 = \frac{d\tau}{dx}$

Q.9] Air flows past a cylinder of diameter  $D = 40 \text{ mm}$  with a velocity  $V = 1.5 \text{ m/s}$ . The air has a density  $\rho = 1.2 \text{ kg/m}^3$  and a dynamic viscosity  $\mu = 1.8 \times 10^{-4} \text{ Pa}\cdot\text{s}$ . Find the velocity at which flow becomes turbulent.

$$Re = \frac{\rho V D}{\mu}$$

$$V = \frac{1.8 \times 10^{-4} \times 2 \times 10^5}{40 \times 2}$$

$$Re_{\text{local}} < Re_{\text{critical}}$$

$$\frac{\rho V D}{\mu} < 2 \times 10^5$$

$$V D < 2 \times 10^5 \Rightarrow V = \frac{2 \times 10^5 \times 1.5 \times 10^{-2}}{40 \times 10^{-3}}$$

$$V = 0.075 \text{ m/s} \Rightarrow V = 75 \text{ mm/s}$$

\* Displacement thickness :  $\delta^*$

It is a distance by which the boundary has to be shifted in order to compensate to loss in flow rate in account of boundary layer formation.

✓ Displacement thickness :  $\delta^*$

loss in flow rate =

$$\delta^* = \int_0^{\delta} \left[ 1 - \frac{v}{V_0} \right] dy$$

✓ Momentum thickness :  $\theta$

loss in momentum =

$$\theta = \int_0^{\delta} \frac{v}{V_0} \left[ 1 - \frac{v}{V_0} \right] dy$$

✓ Energy thickness :  $\delta^E$

loss in energy =

$$\delta^E = \int_0^{\delta} \frac{v}{V_0} \left[ 1 - \left( \frac{v}{V_0} \right)^2 \right] dy$$

$\delta^* > \delta^E > \delta$   
 shape factor =  $\frac{\delta^*}{\delta}$

NOTE

For flat plate laminar flow

Ec)  $\delta^* : \delta^E : \delta$

$\delta^* = \int_0^\delta \left[1 - \frac{u}{v_0}\right] dy$   
 $= \int_0^\delta \left[1 - \frac{y}{\delta}\right] dy = \left[y - \frac{y^2}{2\delta}\right]_0^\delta = \frac{\delta}{2}$

$\delta^E = \int_0^\delta \frac{y}{\delta} \left[1 - \left(\frac{y}{\delta}\right)^2\right] dy = \left[\frac{y^2}{2\delta} - \frac{1}{5\delta} \frac{y^5}{\delta^4}\right]_0^\delta$   
 $= \frac{\delta}{2} - \frac{1}{5\delta} \frac{\delta^5}{\delta^4} = \frac{\delta}{2} - \frac{\delta}{5} = \frac{3\delta}{10}$

$\delta = \int_0^\delta \frac{y}{\delta} \left[1 - \left(\frac{y}{\delta}\right)\right] dy = \left[\frac{y^2}{2\delta} - \frac{1}{3\delta} \frac{y^3}{\delta^2}\right]_0^\delta = \frac{\delta}{2} - \frac{\delta}{3} = \frac{\delta}{6}$

$\delta^* : \delta^E : \delta = \frac{\delta}{2} : \frac{3\delta}{10} : \frac{\delta}{6} = 5 : 3 : 2$

$\delta^* : \delta^E : \delta = 6 : 3 : 2$

NOTE:

① Laminar  $\frac{u}{v_0} = \frac{y}{\delta}$

$\delta^* = \frac{\delta}{2} ; \delta^E = \frac{3\delta}{10} ; \delta = \frac{\delta}{6}$

② Turbulent  $\frac{u}{v_0} = \left(\frac{y}{\delta}\right)^{1/7} = \left(\frac{y}{\delta}\right)^{1/m}$

$\delta^* = \frac{5\delta}{8} ; \delta^E = \frac{5\delta}{m+1}$

③ Shear stress  $\tau = \tau_0 \left[1 - \frac{y}{\delta}\right]$

$\delta^* = \frac{5\delta}{8} ; \delta = \frac{2\delta}{15}$

A flow over a flat plate  $\frac{\partial v}{\partial y} = 0$  at  $y = \delta$

1/4th velocity law:  $\frac{v}{V_0} = \left(\frac{y}{\delta}\right)^{1/4}$ ;  $m=5$

$$\delta^* = \frac{\delta}{m+1} \Rightarrow \left[\frac{\delta^*}{\delta} = \frac{1}{6}\right] \text{ Ans}$$

Q5) For a flow of an air stream with freestream velocity  $V_0 = 10 \text{ m/s}$ ,  $\rho_{\text{air}} = 1.2 \text{ kg/m}^3$ ;  $\nu = 1.5 \times 10^{-5}$  at an instant the displacement thickness  $\delta^* = 0.5 \text{ mm}$  where boundary layer thickness is  $2 \text{ mm}$  calculate loss in flow rate on account of boundary layer formation in kg per meter width per sec (1)

$$Re = \frac{V_0 \times 2 \times 10^{-3}}{1.5 \times 10^{-5}} = 5 \times 10^5$$

$$Q_{\text{loss}} = A_{\text{loss}} \times V_0$$

$$= \delta^* \times \text{width} \times V_0$$

$$= 0.5 \times 10^{-3} \times 1 \times 10$$

$$Q_{\text{loss}} = 5 \times 10^{-3} \text{ kg/m per sec}$$

but answer is asked in kg/s (per meter width)

$$\dot{m}_{\text{loss}} = \rho Q_{\text{loss}} = 1.2 \times 5 \times 10^{-3}$$

$$= \underline{\underline{6 \times 10^{-3} \text{ kg/s}}}$$

PCIET CHHENDIPADA

→ Laminar flow

1) Through circular pipe

Developing length

$$\delta_{max} \text{ (possible)} = R$$

entrance length 'x'

$$\frac{x}{D} = 0.07 Re \text{ (Laminar)}$$

$$\frac{x}{D} = 50 \text{ (Turbulent)}$$

→ shear principle

$$\frac{\partial \tau}{\partial y} = \frac{\partial f}{\partial y}$$

$r = 0$ , at center,  $V = V_0 = V_{max}$ ;  $r = R$  (min) =  $C$   
 $r = R$ , at wall,  $V = 0$ ;  $r = 0$  (max) =  $C$

$$\tau = -\mu \left( \frac{dv}{dr} \right)$$

Here  $y = R - r \Rightarrow dy = -dr$

radial  $x$

$$V = \left( \frac{-\partial f}{\partial x} \right) \left( \frac{R^2 - r^2}{4\mu} \right) = \frac{(P_1 - P_2)(R^2 - r^2)}{4\mu L}$$

$$\frac{\partial P}{\partial x} = \frac{P_2 - P_1}{L} = \left( \frac{P_1 - P_2}{L} \right)$$

$$V_0 = V_{max} = V_{r=0} = \left( \frac{-\partial f}{\partial x} \right) \left( \frac{R^2 - 0}{4\mu} \right)$$

$$V_0 = \left( \frac{-\partial f}{\partial x} \right) \left( \frac{R^2}{4\mu} \right)$$

PDF CHHENDIPADA

40/2/20

$$V = \frac{\left(-\frac{\partial p}{\partial x}\right) \frac{R^2 - r^2}{4\mu}}{\left(\frac{\partial p}{\partial x}\right) \left(\frac{R^2}{4\mu}\right)} = \frac{R^2 - r^2}{R^2}$$

$$\frac{V}{V_0} = 1 - \left(\frac{r}{R}\right)^2$$

⇒ mean velocity:

$$\star \boxed{V_{\text{mean}} = \frac{V_0}{2}} \rightarrow V_{\text{mean}} = \left(-\frac{\partial p}{\partial x}\right) \frac{R^2}{8\mu}$$

$$- Q = AV_{\text{mean}} \rightarrow V_{\text{mean}} = \frac{Q}{\pi R^2}$$

$$Q = \int v \, dA$$

$$\boxed{V_{\text{mean}} = \frac{1}{A} \int V \, dA}$$

→ Hazen-Poiseuille's Equation:

$$Q = \int v \, dA = \int v \, dA$$

$$= \int_0^R \left(-\frac{\partial p}{\partial x}\right) \left(\frac{R^2 - r^2}{4\mu}\right) 2\pi r \, dr$$

$$Q = \left(-\frac{\partial p}{\partial x}\right) \frac{2\pi}{4\mu} \int_0^R (R^2 r - r^3) \, dr$$

$$Q = \left(-\frac{\partial p}{\partial x}\right) \frac{\pi}{4\mu} \left[ R^2 \frac{r^2}{2} - \frac{r^4}{4} \right]_0^R$$

$$\boxed{Q = \left(-\frac{\partial p}{\partial x}\right) \frac{\pi R^4}{8\mu} = \frac{(P_1 - P_2) \pi R^4}{12\mu 4L}}$$

$$\rightarrow V_{\text{mean}} = \frac{Q}{\pi R^2}$$

$$= \left(-\frac{\partial p}{\partial x}\right) \frac{R^2}{8\mu}$$

$$\boxed{V_{\text{mean}} = \frac{V_0}{2}}$$

Check out:

- Revolution of (rectangle) of  $V_{\text{mean}}$  gives cylinder with  $V_{\text{mean}}$  thickness.
- Revolve of parabola gives paraboloid with  $V_{\text{max}}$  thickness.

$$\pi R V_{mean} = \frac{1}{2} \pi R V_{max}$$

$$V_{mean} = \frac{V_{max}}{2}$$

**NOTE**  $\frac{V}{V_0} = 1 - \left(\frac{r}{R}\right)^m \Rightarrow V_{mean} = \left(\frac{m}{m+2}\right) V_{max}$

$$\Rightarrow V_{mean} = \left(\frac{P_1 - P_2}{L}\right) \left(\frac{0.318}{8\mu}\right)^2$$

$$\left[ \frac{P_1 - P_2}{L} = \frac{32\mu V L}{D^2} \right] \left( \frac{V_{mean}}{V_{max}} \right) \Rightarrow \left( \frac{P_1 - P_2}{L} \right) \propto V$$

$$E_1 = E_2 + h_{loss}$$

$$\left[ z_1 + \frac{P_1}{\rho g} + \frac{V_1^2}{2g} \right] = \left[ z_2 + \frac{P_2}{\rho g} + \frac{V_2^2}{2g} \right] + h_f$$

$$h_f = \frac{P_1 - P_2}{\rho g}$$

some of

$$h_f = \frac{4 + LV^2}{4g}$$

for laminar  $f = \frac{64}{Re} \propto \frac{4\mu}{\rho V}$

$$h_f \propto V$$

**NOTE** pressure drop ( $P_1 - P_2$ ) in circular pipe is proportional to velocity

$$\frac{P_1 - P_2}{L} \propto V$$

when viscosity  $\mu$  is const (or given  $\mu$ ) then (Head loss/L) is proportional to  $V^2$

$$\left[ \frac{P_1 - P_2}{L} \right] \propto h_f \propto V^2 \quad (\text{valid when } \mu \text{ is const})$$

$\Rightarrow$  Wall shear stress:

$$\tau = \tau_0 \text{ at } R = -\mu \left( \frac{\partial u}{\partial r} \right) = -\mu \left( \frac{\partial}{\partial r} \left[ \left( \frac{-\partial P}{\partial x} \right) \left( \frac{R^2 - r^2}{4\mu} \right) \right] \right) \Big|_{r=R}$$

$$= -\mu \left( \frac{-\partial P}{\partial x} \right) \frac{1}{4\mu} [0 - 2R]$$

$$\tau_0 = \left( \frac{-\partial P}{\partial x} \right) \frac{R}{2}$$

**NOTE**  $V_{mean} = V_{at} @ 0.707 R$  from center

$$= \left( \frac{-\partial P}{\partial x} \right) \frac{R^2}{4\mu} = \left( \frac{-\partial P}{\partial x} \right) \left( \frac{R^2 - R^2}{4\mu} \right)$$

$$R^2 - R^2 = R^2 \text{ at } R = R/2$$

$$\tau_0 = 0.707 P$$

8) Between parallel plates [fluid flow]

①  $y=0, B$

$$v=0, \tau = \tau_0 = \tau_{max}$$

②  $y=B/2$

$$v = v_{max}, \tau = 0 = \tau_{min}$$

$$v = \left( \frac{-\partial P}{\partial x} \right) \left( \frac{B^2 - y^2}{2\mu} \right)$$

$\Rightarrow$   $v_{max}$

$$v_{max} = v_{y=B/2} = \left( \frac{-\partial P}{\partial x} \right) \frac{B^2}{4\mu}$$

$$\text{--- } v_{mean} \Rightarrow v_{mean} = \frac{1}{A} \int v dx \Rightarrow v_{mean} = \left( \frac{-\partial P}{\partial x} \right) \frac{B^2}{12\mu}$$

$$v_{mean} = \frac{2}{3} v_c$$

(for fluid parallel flow for plates)

③  $P_1 - P_2$

$$v_{mean} = \left( \frac{-\partial P}{\partial x} \right) \frac{B^2}{12\mu} = \frac{P_1 - P_2}{L} \frac{B^2}{12\mu}$$

$$P_1 - P_2 = \frac{12\mu v L}{B^2}$$

④ Head loss ( $h_f$ )

$$h_f = \frac{P_1 - P_2}{\rho g} = \frac{12\mu v L}{\rho g B^2}$$

⑤ Wall shear stress

$$\tau_0 = \tau_{y=0, B} = \mu \left( \frac{\partial v}{\partial y} \right)_{y=0}$$

$$\tau_0 = \left( \frac{-\partial P}{\partial x} \right) \frac{B}{2}$$

8) COVERT flow  
Laminar flow fixed & moving parallel plates

$$2) P_1 - P_2 = \frac{12 \mu v L}{b^2} \quad ; \quad h_f = \frac{P_1 - P_2}{\rho g}$$

$$3) \tau_0 = \left( \frac{-\partial p}{\partial x} \right) \frac{b}{2}$$

GATE -11] The max. velocity in a circular pipe fully developed flow two fixed parallel plates is 6 m/s then  $v_{mean} = ?$

$$\begin{aligned} \rightarrow v_{mean} &= \frac{2}{3} v_{max} \quad (\text{fixed plate}) \\ &= \frac{2}{3} (6) = 4 \text{ m/s} \end{aligned}$$

GATE -215] Laminar through flow circular pipe of radius  $R$ , the local velocity at any radial  $r$  is given by

$$v = \frac{R^2}{4\mu} \left[ \frac{-\partial P}{\partial x} \right] \left[ 1 - \frac{r^2}{R^2} \right] \text{ then the mean velocity of flow = ?}$$

$$v_{mean} = \frac{1}{2} v_{max}$$

$$v_{max} @ r=0 = v_{max} = \frac{R^2}{4\mu} \left( \frac{-\partial P}{\partial x} \right)$$

$$v_{mean} = \frac{R^2}{8\mu} \left( \frac{-\partial P}{\partial x} \right)$$

GATE -16] The pressure drop per unit length for a fully developed flow in a circular pipe of 600 mm dia & 70 kPa over length of 30 m then wall shear stress = ?

$$\begin{aligned} \tau_0 &= \left( \frac{-\partial P}{\partial x} \right) \frac{R}{2} \\ &= \left( \frac{P_1 - P_2}{L} \right) \frac{R}{2} = \left( \frac{70 \times 10^3}{30} \right) \left( \frac{0.3}{2} \right) \end{aligned}$$

$$\tau_0 = 350 \text{ N/m}^2$$

GATE -06] In laminar flow a circular pipe of diameter  $D$  is the local velocity at radial  $r$  is  $v = v_0 \left[ 1 - \frac{4r^2}{D^2} \right]$

then pressure drop across length  $L$  of pipe is

$$\rightarrow v = v_0 \left[ 1 - \frac{4r^2}{D^2} \right] = v_0 \left[ 1 - \frac{r^2}{R^2} \right]$$

from std. eq<sup>n</sup> (above)

$$P_1 - P_2 = \frac{32\mu v_0 L}{D^2} \quad \text{It is } v_{mean}$$

$$v_{mean} = \frac{v_0}{2}$$

$$P_1 - P_2 = \frac{16\mu v_0 L}{D^2}$$

Ex 6) laminar flow through circular pipe?

- (a) 0.005 (b) 0.02 (c) 0.032 (d) 0.04

For circular pipe:

$$f = \frac{64}{Re} \quad f_{min} = \frac{64}{2000} = 0.032$$

→ for open:  $f = 0.025$  to  $0.01$   
 $f = 0.02$  to  $0.04$

Q.15) In laminar flow through circular pipe of radius 10 cm with mean velocity of 5 m/s the local velocity at radial dist<sup>n</sup> r cm

→  $V_{mean} = 5 \text{ m/s} = V$   
 $R = 10 \text{ cm}$   
 $r = r \text{ cm}$

$$V_{mean} = \frac{V_c}{2} \Rightarrow \boxed{V_c = 10 \text{ m/s}}$$

$$\frac{V}{V_c} = 1 - \left(\frac{r}{R}\right)^2 = 1 - \left(\frac{r}{10}\right)^2 = 0.95$$

$$\boxed{V = 7.5 \text{ m/s}}$$
 local velocity.

⇒ Fluid Kinematics (V-I problem)

Q.16)

$$V = \beta(r, \theta, t)$$

$$V \begin{cases} \rightarrow V_s \rightarrow \alpha_s \\ \rightarrow V_n \rightarrow \alpha_n \end{cases}$$

$$a_s = V_s \frac{\partial V_s}{\partial s} + V_n \frac{\partial V_s}{\partial n} + \left(\frac{\partial V_s}{\partial t}\right)$$

$$a_n = V_s \frac{\partial V_n}{\partial s} + V_n \frac{\partial V_n}{\partial n} + \left(\frac{\partial V_n}{\partial t}\right)$$

$$\boxed{a_s = V_s \frac{\partial V_s}{\partial s}}$$

$$\boxed{a_n = \frac{V^2}{R}}$$

RCIET CHHENDIPADA

$$r = 9 \text{ m}, \quad \frac{dv_s}{ds} = \frac{1}{3} \text{ m/s}^2$$

$$d_t = \sqrt{a_s^2 + a_n^2}$$

$$a_s = v_s \frac{dv_s}{ds} = 3 \cdot \frac{1}{3} = 1$$

$$a_n = \frac{v_s^2}{r} = \frac{3^2}{9} = 1$$

$$\rightarrow a_t = \sqrt{a_s^2 + a_n^2} = \sqrt{2}$$

Q. 9

$$a_s = v_s \frac{dv_s}{ds} = 2.5 + 3 \cdot 0 = 2.5 \text{ m/s}^2$$

Q. 10

$$ds = r d\theta$$

$$v_s = 3 \sin \theta$$

$$d_s = v_s \frac{dv_s}{ds} = 3 \sin \theta \cdot \frac{d}{d\theta} [3 \sin \theta] = 3 \sin \theta \cdot \frac{3 \cos \theta}{r d\theta} = 3 \sin \theta \cdot \frac{1}{r} [3 \cos \theta] = 3 \sin \theta \cos \theta \cdot \frac{1}{3} = \sin \theta \cos \theta$$

$$|a| = 1.5 \text{ m/s}^2$$

PCIET CHHENDIPADA

→ For circular pipe:

$$V_{\text{mean}} = 0.82 \text{ to } 0.85 V_{\text{max}}$$

NOTE: The growth of boundary layer will be faster in turbulent zone compare to laminar zone.

Regime: In laminar zone all layers are same so to reach max level time  $\propto r^2$  to  $r^2$

$$\tau = \underbrace{\mu \left( \frac{du}{dy} \right)}_{\text{viscous shear}} + \underbrace{\eta \left( \frac{du}{dy} \right)}_{\text{eddy shear}}$$

$$= \mu \left( \frac{du}{dy} \right) + \rho l^2 \left( \frac{du}{dy} \right)^2$$

where:  $\eta$  = shear property eddy shear co-efficient  
 $l$  = prandtl's mixing length  
 $\mu$  = fluid property  
 $\rho$  = flow property

[High  $Re \Rightarrow \eta \gg \mu$ ]      $\eta \gg \mu$      High  $Re$

⇒ Hydrodynamically (Smooth & Rough)

$$Re_1 < Re_2$$

$$\delta_1 > \delta_2$$

$$\delta = \frac{11.6 V}{\sqrt{Re}} \sim \frac{\delta_1}{\sqrt{Re_1}}$$

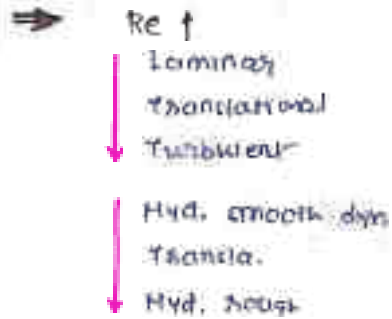

$k = k_s = \text{Avg. surface roughness size}$

state the boundary then it is considered as hydrodynamically rough otherwise (laminar sub layer covers all the surface irregularities) hydrodynamically smooth.

- For a highly turbulent flow (for High Re) the flow may behave like as hydrodynamically rough.

A spherical & cube having same surface area, are completely immersed in water, then the ratio of force of wt. on sphere to cube, (1)

$$A_s = A_c$$

$$4\pi r^2 = 6a^2$$

$$a = \sqrt{\frac{2\pi}{3}} r$$

$$\frac{(F_B)_{sph}}{(F_B)_{cube}} = \frac{\text{force of wt sphere}}{\text{force of wt cube}}$$

$$\frac{(F_B)_{sphere}}{(F_B)_{cube}} = \frac{\rho_w \times \text{Vol}_s}{\rho_w \times \text{Vol}_c}$$

$$= \frac{4\pi r^3}{6a^3} = \frac{4\pi r^3}{6 \left( \frac{2\pi}{3} \right)^{3/2} r^3} = \frac{4}{3} \frac{3^{3/2}}{2^{3/2}} \frac{\pi}{\pi^{3/2}}$$

$$= \frac{(4)^2 (3)^{3/2}}{(6)^3 (2)^{3/2}} \cdot \frac{1}{\sqrt{\pi}} = \frac{\sqrt{2} \sqrt{3}}{\sqrt{\pi}} = \sqrt{\frac{6}{\pi}}$$

$$4\pi r^2 = 6a^2$$

$$\left( \frac{r}{a} \right)^2 = \frac{6}{4\pi} \Rightarrow \frac{r}{a} = \sqrt{\frac{6}{4\pi}}$$

$$\frac{(F_B)_c}{(F_B)_s} = \frac{\rho_w (a^3)}{\rho_w (r^3)} = \frac{4}{3} \frac{\pi \left( \frac{r^3}{a^3} \right) \left( \frac{6}{5} \right)}{\frac{4}{3} \pi \left( \frac{6}{4\pi} \right) \sqrt{\frac{6}{4\pi}}}$$

$$= \sqrt{\frac{6}{4\pi}}$$

Q. An object weighing 100 N in air weighs 80 N in water. Find the relative density of the object.

$$F_B = 20$$

$$(F_B)_{air} = 100 \text{ N}$$

$$(F_B)_w = 80 \text{ N}$$

Relative density of object

$$\frac{W_{air}}{W_{air} - W_{water}} = \text{R.D. object}$$

$$\rightarrow \frac{100}{100 - 80} = s = s_2$$

• Concept of buoyancy force:

This is measurement value of object in air & water is given.

It is not actual weight.

Ans:

$$W' = W - F_B$$

$$100 = W - \rho_{air} \times V \times g$$

$$100 = W - \rho_{air} \times V \quad \text{--- (1)}$$

$$\frac{(1)}{(2)} = \frac{\rho_{air} \times V}{\rho_{water} \times V} = \frac{100}{80} = s$$

$$s = 1.25$$

$$W' = W - F_B$$

$$80 = W - \rho_w \times V \times g$$

$$80 = 100 - \rho_w \times V \times g$$

$$\rho_w \times V \times g = 20 \quad \text{--- (2)}$$

By purchasing any thing we the actual value of weight we take. But if we go into water both are same.

$$\text{Loss of weight} = W - W' = F_B$$

Actual wt. Apparent wt.

Q. An object is floating at the interface of water & mercury such that 30% of its vol is under the water then the relative density of object

$$W_{body} = F_B = \text{Wt of (water + Hg)}$$

$$\rho_b \cdot V = \rho_w \times 0.3V + \rho_{Hg} \times 0.7V$$

$$\rho_b \cdot V = \rho_w \times 0.3V + 13.6 \times \rho_w \times 0.7V$$

$$RD = \frac{\rho_b}{\rho_w} = 0.3 + 13.6 \times 0.7$$

$$RD = \frac{\rho_b}{\rho_w} = 9.82$$

IAS-11) for unchanged mass  
ship entering from sea to water

IAS-11) Ballon filled with mithen  $\rho_{CH_4} = 0.75 \text{ kg/m}^3$   
floating in air  $\rho_{air} = 1.25 \text{ kg/m}^3$ , the min. vol<sup>m</sup> of  
balloon that can lift the man weighing 750 kg

$$W_{(man + CH_4)} = F_B (air)$$

$$mg + (\rho_{CH_4} g)V = (\rho_{air} g)V$$

$$V = \frac{750}{\rho_{air} - \rho_{CH_4}} = \frac{750}{(1.25 - 0.75)}$$

$$V = 1500 \text{ m}^3$$

PCIET CHHENDIPADA

- For a real fluid flow over a solid boundary within the boundary layer zone, for the fluid particles to move backward has to do work against friction at the expense of its kinetic energy. The loss in energy will be recovered from adjacent layers if the work energy. A stage will come at certain pt, where fluid layer may not able to stick to the boundary. Hence it leaves the boundary.
- This point is known as Point of separation: the separation is desirable because behind separation negative pressure exists.

NOTE: 1) at point of separation,

$$\left(\frac{dy}{dx}\right)_{y=0} = 0$$

2) Negative pressure gradient, can <sup>(delay)</sup> prevent separation.  
 $\left[\frac{\partial p}{\partial x} < 0\right]$

3) Any activity which can increase energy of particle near point of separation can delay (prevent) the separation.

→ (Ideal) No separation

$$\Delta p = 0$$

① With separation [wide wake zone]

$\Delta P \neq 0$

$\Delta P \neq 0$

$F_D \text{ DRAG} \neq 0$

② NARROW WAKE ZONE  
[over streamlined body]

$\Delta P = 0$

→ Methods to prevent (delay) separation:

- 1) By ejecting fluid near point of separation
- 2) suction
- 3) By streamlining the body
- 4) By introducing turbulence

→ [functional Drag]

Postcritical regime are subsonic zone
